TABLE OF CONTENTS

1. INTRODUCTION 1-1

1.1 Site Description 1-2
1.2 Statement of Objectives 1-3

2. FIELD ACTIVITIES AND METHODS 2-1

2.1 Field Schedule 2-1
2.2 Digsafe Utility Clearance and Surface Geophysical Clearance 2-1
2.3 Additional Surface Geophysics 2-2
2.4 Overburden Monitoring Well Network 2-3
2.4.1 Well Maintenance and Protective Casing Replacement 2-3
2.4.2 Well Redevelopment and Hydraulic Testing 2-4
2.4.3 Decommissioning of SY-OBMW4 and Installation of SY-OBMW4R 2-7
2.5 Integrated Fracture Trace Study 2-8
2.6 Bedrock Investigation Program 2-10
2.6.1 Bedrock Drilling and Development 2-10
2.6.2 Borehole Geophysical Investigation 2-11
2.6.3 FLUTe FACT and Transmissivity Profile Testing 2-13
2.6.4 Water FLUTe Design and Installation 2-15
2.7 Well Survey 2-17
2.8 Groundwater Sampling 2-18
2.8.1 Groundwater Sampling Timing 2-18
2.8.2 Synoptic Water Levels and Groundwater Elevations 2-18
2.8.3 Overburden Monitoring Wells 2-19
2.8.4 Bedrock Monitoring Wells 2-20
2.8.5 Comparison of Overburden and Bedrock Monitoring Wells 2-20
2.9 Investigation Derived Waste 2-21

3. DATA MANAGEMENT 3-1

3.1 Field Quality Control 3-1
3.1.1 Field Documentation 3-1
3.1.2 Chains of Custody 3-1
3.2 Project Database 3-2

4. ANALYTICAL DATA TRANSMITTAL 4-1

4.1 Analytical Results Overview 4-2
4.1.1 SY-SB4R Soil Results 4-2
4.1.2 Groundwater Results 4-3
4.2 Data Validation and Usability 4-6
4.2.1 SY-SB4R Soil Event 4-6
4.2.2 November 2023 Groundwater Event 4-7

5. SUMMARY 5-1

5.1 SY-SB4R Soil Sampling 5-1
5.2 Nature and Extent of Chlorinated Solvents in Groundwater 5-1
5.3 Well Maintenance Recommendations 5-2
5.4 Data Gap Evaluation 5-3

6. REFERENCES 6-1

APPENDICES

Appendix A.....Photo Log
Appendix B ..... Overburden Monitoring Well Redevelopment Logs
Appendix C .....2022 Hydraulic Conductivity Analysis
Appendix D.....Boring Logs and Monitoring Well Construction Details
Appendix E .....Groundwater Sampling Field Logs
Appendix F.....Laboratory Analytical Reports
Appendix G.....Data Validation Reports and Data Usability Assessment

LIST OF ACRONYMS

µg/L – micrograms per liter
ADR – Automated Data Review
APP – Accident Prevention Plan
ARA – Absolute Resource Associates
ATV – acoustic televiewer
bgs – below ground surface
CENAE – U.S. Army Corps of Engineers New England District
CERCLA – Comprehensive Environmental Response, Compensation, and Liability Act
cm – centimeters
COC – chain of custody
CORS – Continuously Operating Reference Station
Credere – Credere Associates, LLC
CSM – Conceptual Site Model
CVOC – Chlorinated Volatile Organic Compound
DCE – Dichloroethene
DEHP – Bis(2-ethylhexyl) phthalate
DEP – Department of Environmental Protection
DERP – Defense Environmental Restoration Program
DI – deionized
DO – dissolved oxygen
DoD – Department of Defense
DoE – Department of Energy
DQCR – Daily Quality Control Report
DU – decision unit
DUA – data usability assessment
EcoSSL – Ecological Soil Screening Levels
EDD – electronic data deliverable
EGAD – Environmental and Geographic Analysis Database
ELCR – excess lifetime cancer risk
EM – electromagnetic
EnSafe – EnSafe, Inc.
EPA – U.S. Environmental Protection Agency
EPH – extractable petroleum hydrocarbons
eQAPP – electronic QAPP
ERI – Electrical Resistivity Imaging
ERT – Electrical Resistivity Tomography
ESA – Environmental Site Assessment
FACT – FLUTe Activated Carbon Technique
FLUTe – Flexible Liner Underground Technologies
FUDS – Formerly Used Defense Site
FUDSChem – Formerly Used Defense Site Online Chemical Database
    EMI – environmental measurements FUDSChem submittal
    GWD – groundwater level FUDSChem submittal
    LDI – location definition FUDSChem submittal

LTD – lithology FUDSChem submittal
SLX – location cross reference FUDSChem submittal
WCI – well construction information FUDSChem submittal
WINT – well construction intervals FUDSChem submittal
WMI – well maintenance FUDSChem submittal
GAC – granular activated carbon
GNSS – global navigation satellite system
gpm/ft – gallons per minute per foot
GPR – ground penetrating radar
GPS – global positioning system
HQ – hazard quotient
HRGS – Hager-Richter Geosciences, Inc.
IDW – investigation derived waste
IFT – integrated fracture trace
ISM – incremental sampling methodology
K – hydraulic conductivity
KAS – Katahdin Analytical Services, Inc.
LCS – laboratory control sample
LCSD – laboratory control sample duplicate
LDC – Laboratory Data Consultants, Inc.
LOD – limit of detection
LOQ – limit of quantification
MassDEP – Massachusetts Department of Environmental Protection
MCL – Maximum Contaminants Level
mg/L – milligrams per liter
MGS – Maine Geologic Survey
mL/min – milliliters per minute
MNA – monitored natural attenuation
MPS – multi-parameter sonde
MS – matrix spike
MSD – matrix spike duplicate
mV – millivolts
NAVD88 – North American Vertical Datum 1988
NCP – National Oil and Hazardous Substances Pollution Contingency Plan
NE – northeast
NGS – National Geodetic Survey
NTU – nephelometric turbidity units
NW – northwest
NWI – National Wetland Inventory
OPUS – Online Positioning User Service
ORP – oxidation reduction potential
OTV – optical televiewer
P&D – Plisga & Day Land Surveyors
PAH – polycyclic aromatic hydrocarbons
PAL – project action limit
PAT – Purge Analyzer Tool

PCB – polychlorinated biphenyl
PDT – Project Delivery Team
PID – photoionization detector
PVC – polyvinyl chloride
PWS – Performance Work Statement
Q – pumping rate
QA – quality assurance
QAPP – Quality Assurance Project Plan
QC – quality control
QCM – Quality Control Manager
RAG – Remedial Action Guideline
RI – Remedial Investigation
RQD – rock quality designation
RSL – Regional Screening Level
s – drawdown
SDG – sample delivery group
SE – southeast
SEDD – Staged electronic data deliverable
SIM – selective ion monitoring
SOP – Standard Operating Procedure
SSHO – Site Safety and Health Officer
SVOC – semi-volatile organic compounds
SW – southwest
TCE – trichloroethene
TOC – total organic carbon
U.S. – United States
UFP – Uniform Federal Policy
UPL – upper prediction limit
USACE – U.S. Army Corps of Engineers
USFW – United States Fish and Wildlife
USGS – United States Geological Survey
VC – vinyl chloride
VHPFM – vertical heat pulse flow meter
VOC – volatile organic compound
VPH – volatile petroleum hydrocarbons
VRS – Virtual Reference Station
YSI – Yellow Springs Instruments, Inc.

1. INTRODUCTION

Credere Associates, LLC (Credere) was retained by the United States (U.S.) Army Corps of Engineers (USACE) New England District (CENAE) to prepare this Quarterly Report No. 1 – Data Gap Phase to summarize field activities and evaluate any remaining data gaps as part of the ongoing Remedial Investigation (RI) at the Former Salvage Yard at the Former Dow Military Airfield located at 233 Odlin Road in Bangor, Penobscot County, Maine (Site). A Site Location Plan is provided as **Figure 1-1**, and a Site Vicinity Layout, Drainage Plan, & Map of Wetlands is provided as **Figure 1-2**. A project organization flow chart is included as **Figure 1-3** to outline the chain of command used during field activities.

The scope of the field investigations was detailed in the associated Quality Assurance Project Plan, Revision No. 1 (QAPP; Credere, 2022), which amended and updated the original QAPP for the Site prepared by Credere and dated September 19, 2019 (Credere, 2019) to incorporate updated information and the plan for the additional data gap sampling. The QAPP was prepared in accordance with the Uniform Federal Policy (UFP) for Quality Assurance Project Plans (Department of Defense [DoD] *et al*, 2012) and generally with the U.S. Environmental Protection Agency (EPA) Requirements for Quality Assurance Project Plans (EPA, 2001). The QAPP was also developed in accordance with the Performance Work Statement (PWS) prepared by USACE and dated April 22, 2021 (USACE, 2021) with modification dated January 11, 2022 (USACE, 2022). This work is being completed under contract between USACE and Credere (Contract No. W912WJ-23-C-0012). The work required under the PWS falls under the Defense Environmental Restoration Program (DERP) Formerly Used Defense Sites (FUDS), which complies with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and the National Oil and Hazardous Substances Pollution Contingency Plan (NCP). Credere is the prime contractor for the project with subcontractors serving supporting roles (e.g., drilling, geophysical services, laboratory sample analysis).

This is the first of four quarterly Data Gap Phase reports and summarizes field activities completed at the Site from April 2022 to November 2023, including additional surface geophysics, an integrated fracture trace (IFT) study, overburden monitoring well maintenance, well abandonment, bedrock drilling, Flexible Liner Underground Technologies (FLUTe) blank liner installation and transmissivity testing, FLUTe Activated Carbon Technique (FACT) sampling, final FLUTe well design and installation, and the first of four quarterly groundwater sampling events. Note that the additional surface geophysics, the IFT study, FLUTe blank liner installation with transmissivity profiling, FACT sampling, and final FLUTe well design were reported in detail in prior deliverables. These activities are summarized briefly herein to provide context and a generally chronological record of Data Gap Phase activities while limiting report redundancy. Other tasks are reported in their entirety herein, while reserving data assessment for subsequent reports upon completion of the four quarterly sampling events (see below).

Three remaining Data Gap Phase reports will be prepared to summarize the remaining quarterly groundwater monitoring events. This Quarterly Report No. 1 provides cumulative documentation of this data gap phase of the larger RI field program. This report outlines the project and field objectives, summarizes the methodologies implemented in the field, documents deviations and important observations, and data management methodologies utilized in this Data Gap Report No.

1 for all samples collected during this phase of work. Complete laboratory analytical reports for RI activities completed under this data gap phase, as well as a summary of data validation results and a data usability assessment are provided in this report. This report provides a limited interpretation of data to evaluate the presence or absence of data gaps; complete analytical data screening or interpretation is reserved for subsequent submittals (e.g., RI and Risk Assessment).

1.1 SITE DESCRIPTION

The Site encompasses approximately 24 acres and comprises five parcels, one currently owned by the City of Bangor, and four privately owned commercial parcels. The Site work area focused on the City of Bangor-owned 14 acres of vacant land behind three developed and one undeveloped commercial parcels along Odlin Road as depicted on **Figure 1-2**. The Site work area comprises a maintained field and other stands of trees and brush along portions of the southern and western boundaries of the Site.

The Site is located approximately 0.25-miles west of Interstate 95, immediately west of Odlin Road, and immediately south of the current Bangor International Airport (BIA). When Dow AFB and the salvage yard were active, the Site was at the southern end of the then boundary of the AFB.

A degraded paved driveway associated with former buildings is located east of former buildings T-133 and T-134 and connects to Telford Drive, which runs along the northern edge of the Site. A formerly utilized rail spur that served the Dow Air Force Base (AFB) from the Maine Central line parallels the southeast boundary of the Site and an onsite spur ran to the west of former building T-134 where materials were on- and off-loaded; however, the onsite spur tracks have since been disassembled, with the tracks removed from the Site and the wooden ties remaining are stacked on the Site, notably on the southern end adjacent to the former rail line. Small sections of track remained intact at the Site until 2020-2021, when remaining tracks and ties were removed by the City along with clearing of vegetation. The track continued south of the Site for another 300 feet and the tracks and ties from that section of the rail line were also removed at that time.

The above-mentioned properties, which are located outside of the Site work area, and the surrounding area to the south and east are commercial and include a fun park, hotel, gas station, and restaurants. The City of Bangor fire training area adjoins the Site to the northwest and is occupied by a bunker and smoke training concrete block house. To the northwest, the Site is adjoined by BIA and is adjacent to the end of the extended runway and the former ready alert area/hangers (former building 600). One of the commercial properties also operated temporarily as a golf driving range, which extended from Odlin Road across the right-of-entry (ROE) boundary. It is unclear how long the facility operated before the parcel was commercially developed (based on 2011 via imagery).

Hydrology

The Site is located within the surficial drainage basin of the Penobscot River. Sucker Brook to the east of the Site flows southerly and discharges to the Penobscot River 2 miles southeast of the Site in the Town of Hampden. Area streams and surface waters are categorized as Urban Impaired due to water quality, which is monitored by the City of Bangor. Stormwater likely infiltrates the mostly permeable areas of the Site or flows overland off the paved developed portions of the Site. Relict

stormwater management culverts and other subsurface utilities are present at the Site from prior development that may act as current preferential pathways for stormwater movement or subsurface flow. Impermeable surfaces at and immediately adjacent to the Site, as well as stormwater management or other subsurface utility structures, are depicted on **Figures 2 and 5**. The Site also likely receives some runoff from the adjoining airport and runways.

According to the U.S. Fish and Wildlife (USFW) National Wetlands Inventory (NWI) data mapper (USFW, 2018), there are no mapped wetlands, riparian lands, or managed lands at the Site. Given the limitations of NWI mapping tools lacking site-specific details, a wetland survey was completed in November 2018 in accordance with federal wetland delineation procedures. The extent of surveyed Site wetlands is shown on **Figure 1-2**. These areas have been reviewed by a USACE Wetland specialist to confirm the vegetation is consistent with the mapped boundaries.

Additionally, as part of the wetlands survey, stream flow paths were traced for offsite contribution, onsite flow paths, and discharge points for the Site. Topographic data including 2-foot and 10-foot contours downloaded from the Maine GeoLibrary was evaluated during flow tracing, and was considered in conjunction with Credere's field observations during the wetland survey. Stormwater and drainage from the airport discharge directly to the adjoining Fielder's Choice facility (mini-golf) retention pond (339 Odlin Road) and flows overland off the airport to an onsite swale along the northwest side of Telford Drive. The Fielder's Choice pond then drains and enters the southwest corner of the Site via an outfall. Drainage from this area continues southerly through the wetlands area toward Odlin Road and enters a 24-inch culvert along Odlin Road. The culvert then travels southwesterly along Odlin Road. A second drainage path at the Site begins on the westerly side of the railroad spur near the center of the Site (west of former Building T-134). Stormwater is dammed by a berm (historical significance not known) and drains to a small stream that meanders southwesterly and then easterly to a culverted pond/basin near the center of the Site. The culvert runs beneath the paved portion of the Site trending southeasterly and discharges to a swale that parallels the southeastern edge of the Site. These flow paths are shown in black arrows on **Figure 1-2**.

1.2 STATEMENT OF OBJECTIVES

The scope of work presented in the QAPP was intended to further assess trichloroethene (TCE) previously detected in SY-OBMW11. TCE was consistently detected in this hybrid (overburden/bedrock interface) well during four groundwater sampling rounds between 2019-2020 at concentrations ranging from 4.1 to 7.5 micrograms per liter (µg/L). The vertical and horizontal extent of TCE or other chlorinated volatile organic compounds (CVOCs) in downgradient fractured bedrock groundwater in the direction of nearby commercial receptors along Odlin Road represented a data gap, and a better understanding the nature and extent of contamination at the Site was needed to support the RI. In addition, if a shallow plume was present, there could also be a potential soil vapor/vapor intrusion receptor pathway that could need to be evaluated. The ongoing data collection will be used to support development of a conceptual site model (CSM) to be completed as part of the RI.

Specifically, the QAPP included the following problems/questions:

- What is the source of the conductive anomaly in the central portion of the Site?

- Does TCE in groundwater identified in SY-OBMW11 and SY-OBMW12 extend vertically into the bedrock aquifer?
- If TCE extends into the bedrock aquifer, what are the offsite migration pathways?
- Are soil vapor concentrations that would represent a vapor encroachment concern to nearby commercial receptors present?
- What is the best approach to repair frost heaved monitoring wells previously installed during 2019 RI activities?

The following specific objectives were established to address the above listed problems/questions:

- Further assess the conductive anomaly areas to attempt to identify the source of the anomalous response
- Assess the bedrock aquifer by bedrock groundwater sampling for the presence and concentrations of TCE and other CVOCs
- Assess local geology to identify potential migrations pathways if the bedrock aquifer is impacted with TCE
- Assess soil vapor concentrations in the vicinity of the nearby commercial buildings to evaluate vapor encroachment
- Remove rigid concrete pads at affected wells and replace with a protective casing system that accommodates seasonal frost heaving of soils; replace heaved monitoring well SY-OBMW4.

The major investigation tasks to accomplish these objectives under this data gap investigation phase included:

- Completing surface geophysics including 3-D electrical resistivity tomography (ERT) to locate the peak of the conductivity anomaly to target the location for replacement well SY-OBMW4R
- Conducting an integrated fracture trace and geologic mapping study to inform final proposed locations of bedrock wells on-site
- Completing casing and drilling of five bedrock boreholes to a depth of 300 feet below ground surface (bgs) to make geological and hydrogeological observations concerning the nature of bedrock and occurrence of groundwater
- Conducting borehole geophysical logging of bedrock boreholes to identify water bearing fractures and structures to select depth intervals for collection of FLUTe FACT strip samples to screen for the presence of CVOCs in the boreholes
- Collecting transmissivity profiling data in each borehole during installation of blank FLUTe borehole liners to be used in conjunction with borehole geophysical data and FACT data to select depth intervals for multi-level FLUTe wells
- Designing, fabricating and installing water FLUTe systems in each of the five bedrock boreholes

- Collecting bedrock groundwater samples to ascertain the presence and distribution of CVOCs, in particular TCE, in the fractured bedrock aquifer.
- Replacing surface protective casings for applicable overburden wells to prevent future frost heaving, and redeveloping the wells

The execution and results of each of these phases of investigation are discussed in this report along with the Quarter 1 groundwater sampling results.

.

2. FIELD ACTIVITIES AND METHODS

This section summarizes field activities, methods, and associated standard operating procedures (SOPs). Photographs of pertinent Site observations and Site conditions are included as **Appendix A**. New and existing monitoring well locations and pertinent Site features are depicted on **Figure 2-1**.

2.1 FIELD SCHEDULE

The following table summarizes the weekly schedule for these field tasks implemented as part of the RI:

Work Completed	Integrated Fracture Trace Mapping	Additional Surface Geophysics	Overburden Monitoring Well Redevelopment and Rising Head Testing	Bedrock Drilling, SY-OBMW4R Installation with Rising Head Test, Windshield Well Survey	Borehole Geophysics and FLUTe Blank Installation	FLUTe FACT Strip Sampling and Blank Liner Reinstallation with Transmissivity Profiling	Site Restoration	FLUTe Installation	Groundwater Sampling
April 2022	X	X							
June-July 2022			X						
November 2022-February 2023				X					
February 2023					X				
March 2023						X			
July 2023							X		
October 2023								X	
November 2023									Q1 Sampling

Sampling prior to this data gap phase (i.e., data collected prior to 2022) are excluded for the purposes of this report.

2.2 DIGSAFE UTILITY CLEARANCE AND SURFACE GEOPHYSICAL CLEARANCE

Digsafe ticket number 20224403981 was obtained in November 2022 before bedrock drilling activities began. The Digsafe was renewed in January 2023 (ticket number 20230204250 prior to the second drilling mobilization with an alternate drill rig. The Site was pre-marked with locations of subsurface investigation, and DigSafe was notified of the planned drilling work. Member utilities were notified by DigSafe to mark utilities. Non-member local utilities including the Bangor Water District, Bangor Sewer Department, City of Bangor, and State of Maine Office of

Information Technology as identified by OKTODIG were also contacted (tracking numbers W143961 and W146152 for the first and second drilling mobilizations, respectively).

Individual boring locations were cleared by Northeast Geophysical Services of Bangor, Maine, on October 25, 2022, and again on December 2, 2022 in the presence of Credere staff at the request of USACE and to clear an alternate boring location for SY-BRMW4 with greater setback distance from the overhead utility lines transecting the Site. Each individual bedrock boring location (SY-BRMW1 through SY-BRMW5) as well as the replacement overburden well (SY-OBMW4R) were cleared using a Radiodetection RD7100 utility locator as well as ground penetrating radar (GPR). An approximately 10-foot by 10-foot area around each boring was cleared to allow for some adjustment of the locations if needed by the drill rig. Ultimately, the borings were installed within a foot of the cleared and staked location, and no boring/well locations were substantially affected by the findings of the surface geophysical clearance.

2.3 ADDITIONAL SURFACE GEOPHYSICS

Credere contracted Hager-Richter Geosciences, Inc. (HRGS) of Salem, New Hampshire, to perform an electrical resistivity investigation and additional seismic refraction lines to supplement the existing data collected in 2018 and 2019. The purpose of the additional surface geophysics was to obtain sufficient resolution of the soil conductivity anomaly with depth and spatial extent to allow it to be targeted with a confirmation well (SY-OBMW4R). An additional objective was to tighten resolution of the seismically interpreted bedrock surface and evaluate the potential presence of geologic structures that may manifest as dislocations in the bedrock surface.

Electrical Resistivity Imaging

From April 11-15, 2022, HRGS conducted a 3D electrical resistivity imaging (ERI) survey in the area around the soil conductivity/high electromagnetic (EM) anomaly located in the central portion of the Site near the former SY-OBMW4. The 3D ERI survey was conducted using an AGI Super Sting R8 Res/IP system. The unit consists of a power supply, transmitter, receiver, the associated electronics required to measure current and voltage, digital control programs, and an interface box. The system includes at least 56 electrodes and can be instrumented with up to 112 electrodes. Two different pairs of electrodes are selected automatically by the program for current injection and voltage measurement – with many different combinations. The data was processed in the field with a notebook computer to determine the quality of the data. After acquisition of the raw data, the data were transferred to a computer and inverted using AGI EarthImager 3D software.

Two different inter electrode spacings were used to acquire data with both shallow high resolution and deep penetration. A 12-foot x 12-foot interelectrode spacing allowed imaging the electrical properties of the subsurface as deep as 40 feet with high resolution to a depth of about 30 feet. The prior EM31 survey that identified the anomaly indicated a penetration depth to 18 feet bgs, which would suggest the source of the anomaly to be shallower within overburden. Based on the depth of weathered bedrock in boring SY-SB4 at 26 feet bgs, this gives good resolution within the weathered and shallow bedrock zone. A second 20-foot x 20-foot interelectrode spacing allowed imaging the electrical properties of the subsurface as deep as approximately 80 feet with lower resolution in the shallow subsurface. This provides insight into the shallow bedrock of the Site being targeted for bedrock well installation.

Each 3D ERT acquisition array consisted of 112 electrodes for each of the electrode separations, for a total coverage area of 156 feet x 84 feet for each 12-foot setup and 260 feet by 140 feet for each 20-foot setup. Eight 3D ERT acquisition arrays were required for the 12-foot spacing, and four (4) 3D ERT acquisition arrays setup were required for the 20-foot spacings to cover the area of the large EM anomaly. Line orientation was consistent with prior survey that identified the anomaly and was designed to provide enhanced resolution of the prior results.

Supplemental Seismic Refraction

Supplemental seismic refraction was also conducted to refine the bedrock model in the area of interest. The refraction was conducted using the same procedures as the original survey and was completed according to ASTM D 5777-00 (2011) Standard Guide for Using Seismic Refraction Method for Subsurface Investigations to assess the depth and configuration of the bedrock surface along the additional proposed transects. These locations and transect orientation are based on the bedrock contact orientation (i.e., northeast to southwest) and HRGS' previous work at the Site.

A complete discussion of the additional surface geophysics including methodology and results is included in the Surface Geophysical Surveys report prepared by HRGS dated June 2022 (HRGS, 2022), prepared and previously submitted to USACE under separate cover. Upon completion of the additional surface geophysics processing, HRGS transmitted the coordinates of the peak of the soil conductivity anomaly, which were uploaded to a Trimble R2 global navigation satellite system (GNSS) enabled with real-time corrections for sub-foot accuracy and used to site the replacement overburden well SY-OBMW4R at the peak of the soil conductivity anomaly.

Ultimately, bedrock borings were installed within a foot of the originally planned locations, and no boring/well locations were affected by the findings of the additional surface geophysics, including the ERI or the supplemental seismic refraction.

2.4 OVERBURDEN MONITORING WELL NETWORK

The overburden groundwater program included well maintenance and casing replacement, redevelopment and hydraulic testing in addition to the supplemental surface geophysical investigations described above and abandonment and replacement of SY-OBMW4.

2.4.1 Well Maintenance and Protective Casing Replacement

The overburden wells had originally been installed with cement pads cast around the steel protective surface casings and some of these wells experienced frost heaving of the protective casing during cycles of winter freezing and spring thaw likely due to the poorly drained (clay rich) soil conditions. Most of the existing overburden/hybrid wells, including those with minimal or no indications of vertical movement, were modified proactively to prevent future heaving.

From July 20-21, 2022, the existing steel protective casings and concrete pads were removed and disposed of offsite, and new steel protective casings and gravel pads were installed. Exceptions to this replacement included SY-OBMW7 and SY-OBMW10, which were flush mounted in asphalt, and SY-OBMW5, which showed no signs of heaving and was finished with a steel standpipe in asphalt, and would not benefit from replacement with a gravel pad. This replacement also did not

include the original SY-OBMW4 or the two monitoring wells related to the Brownfields Phase II Environmental Site Assessment (ESA), which were to be abandoned (see **Section 2.4.3**). A drain hole was cut into each replacement casing at approximately 6-inches bgs, to drain any accumulated water below ground into a 2-foot x 2-foot x 2-foot crushed stone gravel pad.

2.4.2 Well Redevelopment and Hydraulic Testing

Overburden monitoring well redevelopment was conducted in June-July 2022 and was performed in accordance with Credere SOP CA-9. Monitoring wells were developed by over pumping with a Whale™ submersible pump and surging with dual surge blocks along the length of the screen to bring the screen and filter pack into hydraulic communication with the aquifer and to evacuate sediment from the well. While purging, temperature, pH, dissolved oxygen (DO), oxidation reduction potential (ORP), specific conductivity, and turbidity were monitored using a Yellow Springs Instruments (YSI) multiparameter sonde (MPS) and separate Hach turbidity meter to assess water quality parameter stability. Development was considered complete when the following parameters were stabilized according to the following criteria over three readings spaced 5 minutes apart:

- pH: ±0.1 standard unit
- Temperature: ±3%
- ORP: ±10 millivolts (mV)
- DO: 10% for values greater than 0.5 milligrams liter (mg/L) or less than 0.5 mg/L
- Specific conductivity: ±3%
- Turbidity less than 10 nephelometric turbidity units (NTUs)

Monitoring well redevelopment logs are included in **Appendix B**.

Purge water was discharged to a vegetated surface near each well to allow for re-infiltration with the exception of water purged from SY-OBMW11, which was treated onsite with an in-line granular activated carbon (GAC) filtration bucket.

Rising Head Slug Testing

Hydraulic testing of the overburden wells was completed by slug testing after well redevelopment. Formation hydraulic conductivity (K) was computed at all existing overburden monitoring wells from rising head slug tests conducted in June-July 2022. The rising head test was completed at SY-OBMW4R upon completion of installation in February 2023. Slug tests were performed in accordance with Credere SOP CA-22.

The rising head tests were performed using weighted high-volume (7-foot long) bailers for slug removal and an In-Situ Level Troll 700 transducer probe temporarily installed in each well that was capable of measuring water depth, temperature, and pressure at 0.250 second intervals, which were used to calculate hydraulic head. The Level Troll was connected to an In-Situ Rugged Reader capable of recording test data and displaying data in real time. Approximately 0.90-gallons of groundwater were removed from the well as a slug for each test. Tests were run in duplicate for comparison.

The slug test recovery data was analyzed in AQTESOLV using the Bouwer & Rice method (Bouwer, H. and R.C. Rice, 1976; Bouwer, 1989). Presentation of the analysis is included in **Appendix C**. The Bouwer and Rice equation is appropriate for fully penetrating or partially penetrating wells in either unconfined or confined aquifers if the screened interval is below the upper confining layer (Bouwer, 1989). While a confined aquifer is rare in nature, a semi-confined or leaky aquifer is more common in a completely saturated aquifer that is bounded above by a semi-pervious layer and below by an impervious or semi-pervious layer. A semi-pervious layer has a low but measurable hydraulic conductivity. Deep bedrock for practical purposes is the lower bounding aquifer. Under pumped conditions, lowering of the piezometric surface will result in vertical flow from the semi-pervious layers into the pumped aquifer. Since K of the semi-confining layer(s) is usually very small, for hydraulic analysis purposes, the vertical flow component can be neglected. Thus, the method of analysis is also appropriate for semi-confined systems. A confined or unconfined scenario was selected for each test based on the placement of the screen and nature of the overburden; these criteria are listed under the solution information for each test in **Appendix C**. The hydraulic conductivity for each individual test as well as the average hydraulic conductivity for each duplicate set of tests is presented in **Table 2-1**.

Comparison of hydraulic testing results with observed stratigraphy over the screened intervals does not indicate that the occasional presence of coarser grained interbedded material increases hydraulic conductivity, suggesting these are isolated/laterally discontinuous deposits, where observed. Most of the overburden wells and the hybrid wells have similar computed ranges for K. This suggests the shallow weathered bedrock encountered in most wells and the immediately overlying overburden have similar hydraulic properties. The exceptions are hybrid well SY-OBMW5 and SY-OBMW12, which have Ks approximately an order of magnitude higher than most other wells. This may indicate proportionally higher contributions of water from weathered bedrock.

Well Hydraulic Performance Evaluation

On a quarterly basis, the hydraulic performance of the wells are being evaluated for changes by tracking estimated hydraulic properties from low stress/low flow purging and water level data. Initially, the use of the United States Geologic Survey (USGS) Purge Analyzer Tool (PAT) analytical code documented under Open-File Report 2019–1104 was considered for this purpose. Review of the PAT tool and application of it to actual field data revealed limitations including that a sand pack is not simulated in the model and the code was intended to simulate open borehole well construction in homogeneous or fractured media. The value of the code is in optimizing sampling purge times based on hydraulic computations. In lieu of the PAT tool, computation of specific capacity values was conducted from low stress/low flow purging and stable drawdown water table data. Specific capacity is a reliable and repeatable measure of well performance.

During low stress/low flow sampling, emphasis was placed on achieving a stable drawdown elevation at a known and measured flow rate for calculation of specific capacity, which is defined as the ratio of the pumping rate (Q) to drawdown (s). Specific capacity is typically measured in gallons per minute per foot (gpm/ft) of drawdown.

In the time frame between the last quarterly sampling event in December 2020 and the first quarterly sampling event of this Data Gap Phase in November 2023, all the overburden wells were redeveloped, as discussed in **Section 2.4.2**. Therefore, a comparison of specific capacity before and after development was conducted. The table below in **Exhibit 2-1** compares specific capacity calculations from the low stress/low flow field data sheets from these two events. Green highlights indicate wells with substantial (order of magnitude) improvement in specific capacity.

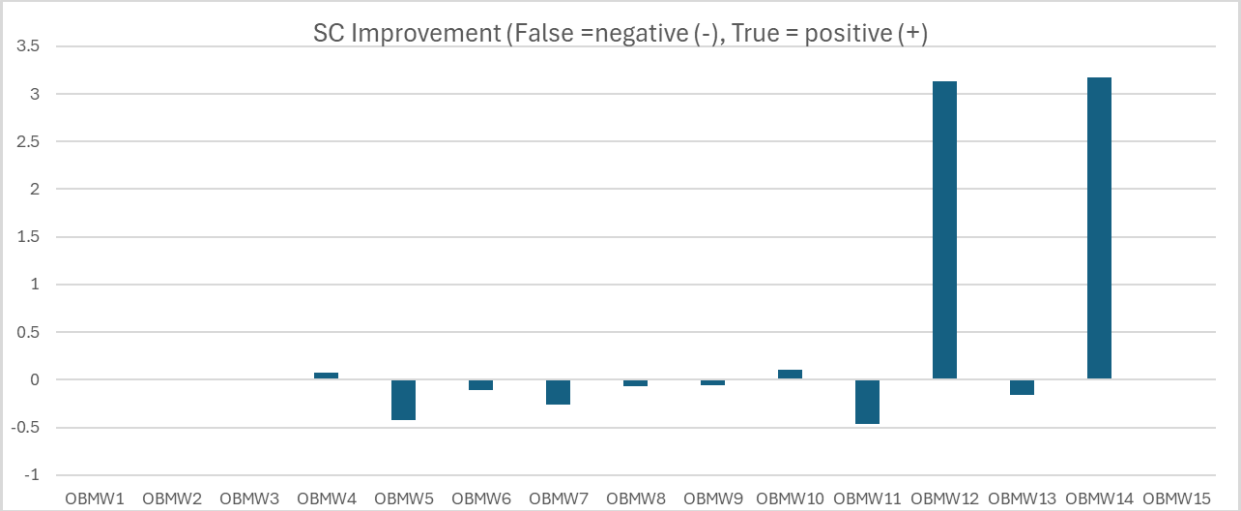

Exhibit 2-1 – Tabulation of Specific Capacity Results (2020-2023)

	December 2020 Low Flow Data			November 2023 Low Flow Data			SC	SC
Well ID	Q	S	SC gpm/ft	Q	S	SC gpm/ft	Logical Test Improved ?	Difference

gpm/ft – gallons per minute per foot
Q – purge rate (ml/min)
S – drawdown (feet)
SC – specific capacity (gpm/ft)

A logical test was then applied to the data to highlight which wells showed an improvement (increase) in hydraulic performance. Most wells showed very slight increases or decreases in specific capacity and these small differences are considered "noise in the data" reflecting a range in sensitivity related to accuracy of flow rate measurements and whether an absolute stable drawdown was achieved. In some wells, drawdown could still be occurring but at a rate so small that it would take an extended time frame to observe definitive water elevation changes. The results of the data are plotted in **Exhibit 2-2** to visually compare these differences.

Exhibit 2-2 – Graphical Representation of Specific Capacity Changes (2020-2023)

Very clearly, SY-OBMW12 and SY-OBMW14 were positively affected by redevelopment and showed almost an order of magnitude decrease in drawdown at comparable flow rates and a corresponding increase in specific capacity. The differences in wells SY-OBMW1- OBMW3 and OBMW15, were so slight as to not even be visible plotted at this scale.

2.4.3 Decommissioning of SY-OBMW4 and Installation of SY-OBMW4R

The SY-OBMW4 riser had heaved and required replacement. Using the opportunity to replace the well, SY-SB4R/SY-OBMW4R was also moved to the peak of the soil conductivity anomaly in the central portion of the Site to aid further assessment of the anomaly's origin. Based on the results of the geophysical survey discussed in **Section 2.3**, SY-SB4R was advanced approximately 15-20 feet northeast of the original location of SY-SB4.

The target location for SY-SB4R/SY-OBMW4R was selected as the peak of the soil conductivity anomaly. The boring location was sited using coordinates provided by HRGS and a GNSS with sub-foot accuracy. The boring was advanced using sonic drilling methods with a Terrasonic 150C drill rig with 6-inch override casing and 4-inch inner casing. The boring was advanced 5 feet into bedrock to confirm the depth of refusal on bedrock and facilitate monitoring well installation with a 2-foot sump. Soil cores were collected continuously in 4-inch diameter by 60-inch length polyethylene sleeves. Sleeves were individually logged according to Credere SOP CA-4, and soil was field screened according to Credere SOP CA-7 for total volatile organic compounds (VOCs) using a RAE Systems photoionization detector (PID) calibrated with a 10-ppm isobutylene gas standard and an instrument response factor of 1.0. The single rock core was logged according to Credere SOP CA-24. Rock quality designation (RQD) was calculated using standard ASTM RQD calculation methods. It is recognized that RQD measurements collected during sonic drilling methods may be biased low due to the potential for sonically induced fractures along natural partings during drilling. As only a single rock core was collected from each boring, these RQDs are considered reliable for purposes of supporting well installation decisions. Boring and well construction logs are included in **Appendix D**.

Two soil samples were collected from SY-SB4R. To be consistent with prior sampling, one soil sample was collected from a 2-foot interval above the transition from surficial fill materials to clay

(but below 0-0.5 feet as this interval has already been sampled nearby in SY-TP18), and the second was collected from 1 foot deeper than the transition to clay or from the interval observed to be the greatest likelihood of a possible source for the conductive anomaly. Based on the conditions observed in the field, these samples were collected from 0.5-2 feet and 2-4 feet bgs.

Visible asphalt and road base materials, landscaping materials, and other organic detritus was removed prior to sampling. In all soil samples, representative soil was collected while wearing new nitrile gloves and using decontaminated hand tools (e.g., stainless steel spoon or spade). VPH/VOC samples were collected directly from the sleeves using a new, dedicated soil syringe immediately after exposure to the atmosphere and determination of the appropriate sample collection depth to minimize loss of volatiles in the sample. The remaining representative soil was placed in a decontaminated stainless-steel bowl (see decontamination SOP CA-2), homogenized, and placed in laboratory provided glassware. Soil samples were placed on ice and submitted to ARA and KAS for analysis. Sample analyses and analytical methods are summarized in **Table 2-2**.

SY-OBMW4R was installed according to Credere SOP CA-8 and consistent with the prior well construction from October 2019. The well was constructed as an overburden well with 2-inch diameter 0.010-inch slotted polyvinyl chloride (PVC) screen installed at the bottom of overburden with a 6-inch solid sump at the bottom at the top of weathered/competent bedrock. Well construction was consistent with prior construction with the exception of a shorter sump to minimize penetration into weathered bedrock. The 10-foot screen was set at least 5 feet below the water table and enough solid PVC riser to reach above the ground surface was installed. Two centralizers were installed on the screen/riser. The well annulus was filled with No. 00S washed silica sand to 1 foot above the top of the screen, and a 2-foot bentonite seal was installed above the sand (i.e., 1 to 3 feet above the screen). The annulus was filled to the surface with sand. A permanent survey notch was cut into the high point of the angularly saw cut top of the PVC riser to allow for consistency of future water level measurements and a vent hole was drilled in the PVC riser below the compression cap. The well was finished with a standpipe, locking cap, and lock. Well development and hydraulic testing were then conducted in accordance with the methodology described in **Section 2.4.2**. A well construction log is included in **Appendix D**.

2.5 INTEGRATED FRACTURE TRACE STUDY

An IFT study was conducted by Credere in 2022 and was reported under separate cover (Credere, 2023a). The study integrated the results of geologic field mapping and a fracture trace photolineament study. Prior to this work, preliminary borehole locations for the bedrock wells were proposed based on inferred down gradient locations from the only well (SY-OBMW11) in which TCE had previously been detected. SY-OBMW11 was a hybrid well screened across both glacial deposits and underlying weathered bedrock. It was not clear if the TCE detected in that well represented diffusive flux from the clay rich till or the weathered bedrock.

The IFT did not identify any possible fracture traces within the boundaries of the Site and therefore did not recommend alternative locations for any of the proposed bedrock borings. The IFT identified a lineament trace that lies outside and close to the northeastern most corner of the Site that is aligned parallel to a well incised drainage that trends towards the north-northwest. The general stratigraphy at the Site consists of glacial till deposited on Ordovician/Silurian bedrock.

Glaciomarine clays onlap the till and likely obscure geologic fabric or scarps related to underlying structure in the bedrock and till mantle.

Both the surficial and bedrock geology of the Bangor 7.5-minute topographic quadrangle, which encompasses the Site, have been mapped, interpreted and published by the Maine Geologic Survey (MGS). Surficial geology was mapped by Kent Syverson and Andrew Thompson and presented in Open-File Report No. 11-6 published in 2011 (MGS, 2011a). Bedrock geology was mapped by Stephen Pollock and published in Open-File report No. 11-57 in 2011 (MGS, 2011b). The Site is located wholly within the Penobscot River Member of the Bangor Formation, which is described as a medium to dark gray, medium to very fine-grained metamorphosed greywacke (metawacke). Siltstone and claystone are minor lithologies within this member. Metawacke beds vary from 15 centimeters (cm) to in excess of 2 meters and may exhibit parallel or ripple cross-laminations and may be graded.

Based on published mapping, bedding and foliation (slatey cleavage) trend northeast bedding in the Penobscot Member dips steeply to the northwest (72 - 88 degrees) and is commonly overturned. Bedding in the Penobscot formation east of the Kenduskeag Stream also dips to the Northwest at moderate to steep angles (50 - 75 degrees) but is normal and not overturned. Foliation also dips northwest at similar steep to vertical angles and is generally subparallel to bedding. Collectively, the foliation and bedding features suggest the Penobscot Formation in vicinity of the Site locally contains a synclinal structure with younger protolith beds (the Lovers Leap and Kenduskeag Members) within its core. MGS mapping to the northeast of the Site indicates the presence of outcrop scale overturned folds within the formation. Steep northwesterly trending joints are ubiquitous where outcrops are present, dipping to the southwest and northeast from 60 – 88 degrees. Joints that strike southwest are also present and these tend to dip to the southeast from 34 – 85 degrees.

Bedrock mapping was conducted by Credere along roadside outcrops and within the Eurovia Quarry that is located approximately one mile southwest of the Site. Representative photos collected during the IFT field effort are included as **Photographs 7 through 11** in **Appendix A**. Equal area stereonet projections of fracture features mapped in outcrop indicate the predominant fractures are bedding parallel features dipping predominantly to the northwest consistent with published MGS geologic maps. A smaller subset of bedding parallel fractures dip steeply to the southeast and likely represent axial plane fractures. These fractures are crosscut by joints that trend northwest and dip steeply to the northeast (NE) and southwest (SW). A smaller subset of joints trend more to the north-northwest (NW)/south-southeast (SE) and to west-NW/east-SE. The Eurovia quarry has been developed to a depth of approximately 0 feet North American Vertical Datum 1988 (NAVD88) and measures approximately 1,200 feet along strike and 1,000 feet across strike. Two unstable fault zones with identifiable breccia fragments in the cuttings were drilled at the Site, in SY-BRMW2 and SY-BRMW5, and are believed to be structurally similar to faults observed at the quarry. The quarry affords exceptional vertical exposures of bedrock and the ability to observe the nature of fault structures that are otherwise difficult to discern in smaller, weathered roadside outcrops. One of the larger faults that could be closely observed at Eurovia showed well developed uncemented breccia (fault gouge) within steeply dipping metawacke with pronounced drag folding. In the quarry exposures, jointing had pronounced iron oxidation along closely spaced planes and appeared to occur as swarms in some localities. Bedding fracture

features were also well oxidized indicating preferential water movement along both bedding plane and joint features. Bedding planes are perhaps more frequent by a factor of 2. Overall, the results of borehole geophysical logging were consistent with the orientation of fracture features observed in outcrop as discussed in the next section.

A complete discussion of the IFT methodology and results is included in the Integrated Fracture Trace Analysis and Report (Credere, 2023a) prepared by Credere and dated October 2023, which was previously submitted to USACE under separate cover. The report also includes the final borehole geophysical logs (summarized in **Section 2.6.1**). The IFT did not affect the final placement of the bedrock monitoring wells.

2.6 BEDROCK INVESTIGATION PROGRAM

The bedrock investigation program, which consisted of drilling and geophysical logging of five 300-foot bedrock boreholes instrumented with Water FLUTe muti-port sampling systems (FLUTe systems), was conducted following completion of the IFT Report (discussed in **Section 2.5**). As the IFT report did not affect the placement of bedrock monitoring wells, wells were installed in the locations originally depicted in the QAPP (except for SY-BRMW4, which was relocated a short distance northwest to allow the drill rig to be a safe distance from the overhead power lines transecting the Site).

2.6.1 Bedrock Drilling and Development

A total of five bedrock wells installed to a depth of 300 feet were planned at locations upgradient, adjacent and downgradient to well SY-OBMW11, where TCE was previously detected. The purpose of these wells is to evaluate the presence or absence of TCE or other related CVOCs in bedrock groundwater and if present allow interpretation of the vertical and horizontal nature and extent. The upgradient well was intended to verify whether TCE had migrated onto the Site from an upgradient (off-site) source.

Bedrock borings were advanced by Cascade Environmental, LLC, using a Terrasonic 150C sonic/air hammer drill rig. Bedrock drilling took place during an initial mobilization from November 30 to December 17, 2022, and during a second mobilization from January 18 to February 2, 2023. Overburden drilling and casing sockets into the top of bedrock were completed by sonic methods. Casing sockets were drilled using 8-inch diameter tooling sufficiently deep into rock with increasing competence to allow 6-inch casing to be telescoped into the rock socket and tremie grouted with Portland type II cement mixed with approximately 3-5% bentonite. The depth of the socket was minimized to avoid excluding an excessive amount of shallow bedrock from the open borehole while still providing a good seal and a secure casing. The total depth of casing ranged from 29 to 47 feet bgs, and the depth of casing into competent bedrock ranged from 3 to 10 feet. This information is summarized in the monitoring well construction logs in **Appendix D**.

After a minimum of 2 days to allow the casing grout to set, boreholes were advanced to approximately 300 feet bgs by air hammer methods. Rock chips were collected from below a cyclone air/drill cuttings separator and logged on approximate 1–2-foot intervals. Water production was also estimated periodically by measuring the time required to fill a 5-gallon bucket with return water, and observations regarding the color/clarity of the return water were also

recorded. Drilling water yields ranged from as little as approximately 0.5 gallons per minute (gpm) in SY-BRMW3 to over 100 gpm in SY-BRMW5. These observations are included in the boring logs in **Appendix D**.

Two boreholes, notably upgradient location SY-BRMW2 and downgradient location SY-BRMW5, intercepted brecciated fault zones that were structurally unstable and resulted in subsequent borehole collapse after development (90 feet and 130 feet bgs respectively). A direct push rig was mobilized to the Site and the boreholes were cleared by pushing obstruction rubble to the bottom of the boreholes. The boreholes remained open and unobstructed for the reminder of the work. These fault zones had similar orientations based upon the borehole geophysics (summarized in **Section 2.6.2**), however, these are interpreted to be separate structures. The structures with largest open aperture in SY-BRMW2 from 87.7 to 92.9 feet bgs dip at moderate angles (47-55 degrees) to the northwest (288 to 330 degrees azimuth) and are predominately parallel to bedding strike. One large aperture feature dipped steeply at 73 degrees to the NE (44 degrees azimuth) and crosscuts bedding. SY-BRMW5 intersected a shallow (60.1 – 62.1 ft bgs) open aperture fault structure and a deeper fault (127.5-128.8 ft bgs). The shallower fault zone in SY-BRMW5 contained intersecting structures, one dipping moderately to the northwest and the other dipping moderately to the southeast, and therefore strike sub parallel to regional bedding strike. In the deeper zone, the largest open aperture feature dips moderately (36 degrees) to the east. Other fault planes dip at moderate angles to the north and southeast. Whether these represent primary and secondary conjugate structures is not clear. The shallower and deeper structures at SY-BRMW5 would be expected to intersect outside the borehole. The distance between SY-BRMW2 and SY-BRMW5 and the depths and orientations of these structures indicate they are separate and distinct features.

After the target depth was reached in each borehole, well development was completed by using the air hammer to flush each well for approximately 1-hour with the air hammer set at the bottom of the well to purge any accumulated sediment. Rods were also gently surged in the borehole. Development was monitored by a Credere geologist and continued until purge water from the borehole ran visibly clear. Unlike sonic drilling, air hammer drilling purges most cuttings from the borehole during drilling.

2.6.2 Borehole Geophysical Investigation

Borehole geophysical logging was conducted by HRGS after borehole development to:

- Assess the depth and orientation of transmissive bedrock features intersected by the borehole
- Assess overall bedrock structures including bedding and fracture orientation, estimates fracture aperture, evidence of hydraulic activity
- Assess the flow conditions in the boreholes under ambient and stressed conditions
- Assess the depths of changes in lithology in the bedrock penetrated by the borehole
- Assess the appropriate depths for installation of the FLUTe well port intervals

The purpose of borehole geophysics was to acquire very detailed, depth specific information about the bedrock structure in each borehole and identify hydraulically active fractures. This information

supported the design of the FLUTe well systems/selection of sampling intervals at depths which could reasonably be expected to produce water, such that samples could be collected to fulfill the objectives of the QAPP and avoid installation of an unusable sampling port. Identification of hydraulically active and potentially active fractures was also used in selecting depth intervals for FACT strip sampling, the results of which were also considered in FLUTe system port design.

Borehole geophysics included the following in the indicated order:

1. fluid temperature & fluid conductivity/resistivity
2. optical televiewer (OTV)
3. acoustic televiewer (ATV) and acoustic caliper
4. vertical heat pulse flow meter (VHPFM) under ambient conditions to measure vertical flow of water in the borehole and where water enters and exists the borehole
5. VHPFM under pumping (stressed) conditions to measure vertical flow of water in the borehole in response to pumping

The borehole geophysical logging tools used, and the associated data collection objectives are shown in the table below in **Exhibit 2-3**. The electrical logs, OTV, ATV and caliper data were reviewed in the field to preliminarily identify prospective water bearing fractures and fracture zones. These data were acquired under ambient conditions except the VHPFM data, which was acquired under both ambient and stressed (pumping) conditions. The VHPFM data was acquired at discrete depths which were determined in the field after reviewing the other borehole geophysical data sets. Ambient VHPFM data was collected when the logging tool was run down the borehole and stressed data was collected while the tool was being retrieved. The VHPFM is placed both above and below a fracture to determine if measurable ambient or stressed borehole flows are upward or downward and where groundwater enters and exits the borehole. The stressed conditions were induced by pumping water out of the borehole at a controlled rate (generally less than 1 gpm) while acquiring the VHPFM data. The pumping rate was monitored continuously by an inline rotameter to maintain a constant flow rate. During the VHPFM logging under ambient and stressed conditions, the water level in the borehole was monitored manually. Data was recorded in digital format in the field on a portable computer. Additional information on data collection, properties measured, and data processing is summarized in **Exhibit 2-3** and following paragraphs below.

Exhibit 2-3 Geophysical Logging Tools and Data Quality Objectives

Logging Tool	Measured Property and Data Quality Objective
Fluid Temperature/Fluid Conductivity, Fluid Resistivity	Measures fluid temperature as indicator of temperature disturbances indicating where water may enter or exit the borehole, electrical resistivity, and conductivity as an indicator of water from different transmissive units collectively these properties evaluated as indicator of water producing zones.
ATV	Measures fractures, foliation and bedding planes and geologic unit contact orientation where sufficient acoustic contrast is present, develop acoustic aperture estimates, and can be implemented in turbid borehole fluids. .

Logging Tool	Measured Property and Data Quality Objective
OTV	Measures fracture and geologic unit contact orientation and vertical extent. Requires relatively clear borehole fluids.
VHPFM	Measures ambient and induced head vertical flow capacity in gallons per minute. Readings taken below and above suspected producing zones under ambient and pumping conditions allow assessment on individual fracture contribution to borehole flow and determine where water enters and exits the borehole. Where flow rates exceed the operational limits of the flow meter, transmissivity data will be used.

Depth data for the logging was collected from ground surface. The borehole logging report (HRGS, 2023) consisted of borehole image logs and borehole geophysical logs, the former at a scale of inch -1.5 feet and consisting of the following data tracks:

Track #	Log & Description
1.	OTV Image
2.	Depth
3.	ATV Amplitude
4.	ATV Travel Time Structure Projection – bedrock structure interpretation plotted in projection view
5.	Caliper – borehole diameter in inches Tadpole Plot – bedrock structure interpretation plotted as tadpoles
6.	OTV Virtual Core
7.	Depth
8.	ATV Virtual Core

The borehole logging report included borehole summary tables of the borehole flows under ambient and pumping conditions, water levels during VHPFM testing, bedrock structure statistical plots, tables of tabulated bedrock structures, and borehole deviation logs. The borehole geophysical report was previously provided to USACE under separate cover as an attachment to the FLUTe Well Design – Depth Interval Selection memorandum prepared by Credere dated September 6, 2023 (Credere, 2023b).

Smaller fractures and fracture intervals are readily identifiable based on borehole logs (caliper, OTV, ATV, temperature, and fluid conductivity) and measurable flows were identified associated with more prominent fractures during VHPFM logging. In addition, the presence of other water bearing and potentially water bearing fractures that do not have VHPFM signatures are indicated by caliper, OTV and ATV logs and by reductions in liner descent rate and computed changes in borehole transmissivity in the FLUTe transmissivity profiles as discussed in the next section.

2.6.3 FLUTe FACT and Transmissivity Profile Testing

After borehole geophysical logging was conducted, blank borehole liners were installed with FACT liner sleeves in each borehole. The FACT sleeves have a 1.5-inch wide continuous strip of activated carbon felt that is emplaced against the borehole wall to sorb organic solvents, if present. When the liners are retrieved (inverted) the carbon strip is sectioned, placed into sample containers

and sent off for laboratory analysis. FACT liners aid in the identification of CVOCs within borehole fracture intervals, for consideration during design of the FLUTe well systems (i.e., selection of sampling port depths). At most boreholes, FLUTe staff set up scaffolding and a PVC casing extension to create greater driving force (increased head) during installation of the FLUTe blank liners, to accommodate the shallow depth to groundwater in the borehole casings. When necessary to increase driving heads, FLUTe also added several feet of bentonite slurry/grout in the inside bottom of the blank liner to initiate liner eversion and installation during transmissivity profiling. The greater density of the bentonite provides additional driving force that accelerates the initial liner eversion and in the case of transmissivity testing improves the consistency of the early time data.

FACT liners were allowed to equilibrate with the borehole wall for between 26 and 36 days. The duration of FACT deployment in each borehole is summarized below:

- SY-BRMW1: 35 Days
- SY-BRMW2: 26 Days
- SY-BRMW3: 36 Days
- SY-BRMW4: 35 Days
- SY-BRMW5: 36 Days

FACT strips were recovered in March 2023 as described in **Section 2.1**. Work was performed primarily in late winter conditions; however, no issues arose with FACT material freezing. The FACT strip in SY-BRMW2 was deployed for a shorter time than other FACT strips, as a collapse in the borehole required remobilization of drilling equipment to clear the obstruction and forced a pause in FLUTe installation activities. Once the borehole was cleared, FLUTe remobilized and installed the FACT strip in SY-BRMW2. Approximately 4 weeks later, all FACT strips were removed in the same week, with SY-BRMW2 removed last. The duration of 26 days meets the objective stated in the QAPP.

During this equilibrium period, geophysical logging data summarized in the HRGS Borehole Geophysical Logging Report (HRGS, 2023) was interpreted, and a spreadsheet was developed to identify borehole zones where potential transmissive fractures were present to make recommendations for the number, location (borehole and depth) and sample designations for FLUTe FACT samples to be collected for analysis of VOCs. This spreadsheet was provided to USACE for review and discussion with the Project Delivery Team (PDT). Intervals targeted for segmenting and laboratory analysis were agreed upon and approved by the PDT on a virtual team meeting on March 7, 2023 and the final proposed sampling plan was transmitted to USACE for submittal to Maine DEP for information purposes. A total of 115 5-foot-long FACT samples were identified and collected.

To sample the FACT liner, blank liners were removed and separated from the carrier cover, FACT strips were sectioned and placed in sampling jars preserved with deionized (DI) water. The FLUTe FACT samples were preserved on ice and sent under chain of custody to Hall Environmental Analysis Laboratory in Albuquerque, NM for analysis for VOCs by EPA Method 8260.

After the FACT liner was sectioned and sampled, the blank liner was re-everted into the borehole and transmissivity profile data collected. The transmissivity profile was completed by measuring the liner tension and velocity propagation down the borehole and continuously measuring water level (head) in the liner as a measure of driving force. As a fracture is sealed by the liner, velocity decreases and is a direct measure of the flow rate into that zone before it was sealed. The liner velocity was measured every 2 seconds and water levels were measured with a transducer. The pressure below the liner was calculated as a function of tension on the liner. The borehole transmissivity was then calculated using the borehole diameter developed from the borehole logging. FLUTe provided a final FACT Data report on August 24, 2023, with the VOC analytical results and the FLUTe Transmissivity Profiles (FLUTe, 2023).

Laboratory analytical data of FACT strip samples did not indicate the presence of VOCs, including CVOCs, except for toluene and benzene. Toluene is known to be a constituent of the FLUTe liner material, and benzene was clearly associated with the toluene. These VOCs are inconsistent with compounds historically detected at the Site and were also detected in sample blanks. Therefore, these compounds are not attributed to the Site environment and are not considered indications of the presence of contamination. The presence of toluene is viewed as a groundwater flow indicator, as it is leached from the FLUTe liner and adsorbed by the adjacent FACT strip under ambient flow conditions. Toluene as a proxy of groundwater flow and such results at the Site are discussed further in the FACT Data report (FLUTe, 2023).

The transmissivity profile data were incorporated into an integrated borehole log with the geophysical data. These non-detect results for other VOCs were not incorporated into the geophysical logs because the data provided no added contribution to the FLUTe interval design/decision process.

2.6.4 Water FLUTe Design and Installation

A FLUTe Well Design – Depth Interval Selection memorandum (Credere, 2023b) was prepared and submitted under separate cover, outlining the data for each decision criteria for the FLUTe design. This memorandum was reviewed and approved by the PDT and subsequently provided to Maine DEP on September 6, 2023, for concurrence on sampling intervals. A conference call was held with Maine DEP on September 8, during which Maine DEP verbally concurred with the design. The memorandum included an integrated borehole log that combined geologic observations, borehole geophysical data, and FLUTe transmissivity profiles was developed to assist selection of fracture intervals to be monitored by the FLUTe ports. The contract specification was three ports per borehole.

As indicated in the QAPP, the primary objective for the FLUTe installation was to select fracture intervals with the potential to contain highest TCE concentrations, and which could be used to map vertical plume distribution, including plume bottoms. The primary decision data was to be evidence of VOCs, primarily CVOCs, in the FACT data, followed by fracture specific hydraulic data from borehole logging, and transmissivity profiling.

Due to absence of FACT strip detections for CVOCs, the secondary decision criteria for proposed intervals was to select water bearing zones that provided a randomized monitoring network that contains a variety of fracture types and orientations with spatial coverage across the aquifer.

Transmissive fractures strike dominantly to the northeast, dipping northwest, parallel to meta-sedimentary bedding. Therefore, three vertically distributed intervals were initially proposed; shallow, mid-depth, and deep, in each borehole, to span the aquifer at each borehole location. The shallow interval is defined as the bottom of casing depth to 100 feet bgs, the mid-depth intervals is designated between 100-200 feet bgs, and the deep interval from 200-300 feet bgs. Within the shallow interval, the shallowest water bearing fractures were prioritized. In several boreholes, large geologic structures (faults) were encountered that represented the most transmissive geologic features.

The proposed secondary objective in the QAPP to create a randomized monitoring network was modified during PDT consultation to move the deepest interval in two boreholes (SY-BRMW1 and SY-BRMW5) to an interval spanning the bottom of casing to approximately the first 10 feet of the bedrock borehole. The shallow interval in SY-BRMW3 was also moved from the shallowest interval containing possible transmissive fractures (approximately 67-77 feet bgs) to just beneath the bottom of casing (approximately 47-62 feet) to capture any possible flow at the base of the casing.

In the absence of FACT data, which did not indicate any contaminated depth intervals, the depths recommended for FLUTe sampling intervals included a mix of larger aperture fractures, as well as smaller aperture fractures. All selected intervals had positive VHPFM response under ambient or pumping conditions and are considered to be highly transmissive relative to other fractures within each borehole. Although more than three transmissive intervals are present in each borehole based on VHPFM and transmissivity profile data that could be successfully sampled, the recommendations included just three primary intervals, as this was the design specification in the QAPP.

The following intervals were proposed for FLUTE liner fabrication:

- SY-BRMW1
    - 42-52 feet below ground surface (bgs) (Port 1)
    - 65-75 feet bgs (Port 2)
    - 150-157 feet bgs (Port 3)
- SY-BRMW2
    - 62-72 feet bgs (Port 1)
    - 82-97 feet bgs (Port 2)
    - 254-264 feet bgs (Port 3)
- SY-BRMW3
    - 47-62 feet bgs (Port 1)
    - 145-155 feet bgs (Port 2)
    - 287-297 feet bgs (Port 3)

- SY-BRMW4
    - 62-72 feet bgs (Port 1)
    - 138-148 feet bgs (Port 2)
    - 291-301 feet bgs (Port 3)
- SY-BRMW5
    - 29-44 feet bgs (Port 1)
    - 56-66 feet bgs (Port 2)
    - 123-133 feet bgs (Port 3)

The FLUTe systems were fabricated and delivered to the Site on October 12, 2023, with installation commencing on October 17, at SY-BRMW2. On October 17, an apparent leak was identified in the SY-BRMW2 Water FLUTe when it reached approximately 270 feet bgs. On October 18 the system was pulled, and it was determined the pump tube line separated at the port where the spacer penetrates the liner in 2 of the 3 ports (the 82-97 foot and 254–264 foot intervals). Ultimately the liner was repaired in the field and re-installed on the last day of the deployment (October 25). The blank liner was re-installed during the time when the system was out of the borehole for evaluation and repair. The reinstallation required the liner to be repositioned upward approximately 16 inches from its original depths but the extra overlap of the ports on the borehole were sufficient to monitor the fracture zones as originally intended. As such, the final sample intervals were repositioned 1.5 feet above the original proposed depth intervals and are listed below:

- SY-BRMW2
    - 60.5-70.5 feet bgs
    - 80.5-95.5 feet bgs
    - 252.5-262.5 feet bgs

The FLUTe system in SY-BRMW5 temporarily hung up on the ledge at the bottom of the fault at approximately 128 feet bgs but eventually everted through that zone. All other FLUTe systems were installed without mishap, tested to demonstrate functionality and confirmed to be viable for groundwater sampling, and secured with a metal locking cover.

2.7 WELL SURVEY

A global positioning system (GPS) survey was conducted by Maine-licensed Plisga & Day Land Surveyors (P&D) on January 4 and 24, 2024, to establish the as-built elevations and coordinates of the bedrock monitoring wells and the replacement overburden well SY-OBMW4R, in accordance with the vertical accuracy required by USACE Engineering and Design Manual "Control and Topographic Surveying" EM 1110-1-1005 1 January 2007 and transfer of those elevations as recommended by EM 1110-1-1003. The two permanent benchmarks installed by P&D in August-November 2020 were used to tie wells into the existing well network (aluminum disks: one installed outside the door at Building 600 across Telford Drive and the second in the concrete catch basin rim within the swale paralleling Telford Drive). An Online Positioning User

Service (OPUS) solution was obtained and three wire levels were run to the benchmarks with required vertical control of +/- 7 millimeters (mm). The surveyors consulted with the USACE geodetic branch to confirm technical requirements prior to conducting the survey work. The benchmark with the best GPS characteristics were submitted to OPUS and three wire line surveys were completed to the other benchmark.

Sample location/well northing and easting coordinates were georeferenced to the Maine Coordinate System of 1983, East Zone (NAD83_2011, Epoch: 2010.000) with units of U.S. Survey Feet using GPS tied to the National Geodetic Survey (NGS) Continuously Operating Reference Station (CORS) network (via Maine Department of Transportation Virtual Reference Station [VRS] GPS control network). Elevations were referenced to NAVD88 (2011) using the GEOID18 model to adjust GPS derived ellipsoidal heights (referencing NAD83 (2011)) to orthometric heights (NAVD88 (2011)) for the permanent benchmarks installed and observed in 2020. Collected survey points were delivered to Credere in Adobe PDF and Microsoft Excel format.

Site survey data was uploaded to the FUDS Online Chemical Database (FUDSChem) via a Location definitions (LDI) Update and Well Maintenance (WMI) submissions.

2.8 GROUNDWATER SAMPLING

2.8.1 Groundwater Sampling Timing

The timing of groundwater sampling was to be based on the high, low, and baseflow conditions from the USGS stream gauging and associated well monitoring networks. The timing objective was to target low flow but increasing water level conditions in the stream and as indicated by the USGS well ME-PEW456 reference well collected over the past 5 years. The reference well is a 6-inch diameter confined open bedrock well installed to a depth of 101 feet below ground surface at a comparable land surface elevation of 194.24 feet NAVD88. The well is located approximately 9 miles northwest of the Site (318 degrees). The Kenduskeag stream Monitoring Station 01037000 is located approximately 4.8 miles north northwest of the Site below where Route 15 crosses the stream (349 degrees). On October 2, 2023, Credere submitted a recommendation by email for the timing of the first/fall sampling event based on stream flow data from Kenduskeag Stream and water level data from. The proposed sampling window was the first full week of November and was approved by USACE.

2.8.2 Synoptic Water Levels and Groundwater Elevations

Synoptic water levels were collected at the Site in conjunction with the groundwater sampling event with the objective of mapping the potentiometric surface for interpretation of groundwater flow directions, water level measurements were made to the nearest 0.01 feet and all water levels meters were compared for relative accuracy by measuring the same well prior to start of a synoptic water level round. Depth to water (all wells) and total well depth (overburden wells only) were measured at each well, including all three ports and the tag line in each FLUTe well, during synoptic gauging round on November 6, 2023. Gauging results and calculated elevation are summarized in **Table 2-1** for overburden wells and **Table 2-3** for bedrock wells.

Monitoring well locations, groundwater elevations, and interpreted bedrock groundwater potentiometric contours for the 2023-2024 Quarter 1 groundwater sampling are depicted on **Figures 2-3a through 2-3c**, and are representative of groundwater elevations from shallow (Zone 1), medium (Zone 2), and deep ports (Zone 3), respectively. Some shallow ports are closely spaced and averaged values were used if the absolute head values were close mathematically for contouring purposes. In all zones interpreted groundwater flow is to the southeast, indicating the downgradient well network is appropriately positioned. Overall, vertical gradients in bedrock are downward but, in most wells, there is a convergence of heads in the middle portion of the aquifer which may reflect a zone dominated by horizontal flow. The possible effect of vertical gradients on interpreted groundwater flow characteristics will be evaluated more fully after multiple monitoring rounds are completed and the transient or temporal consistency of vertical gradients becomes better established. The vertical and horizontal gradients are consistent with a bedrock groundwater system flowing toward and potentially discharging, in part, to the Penobscot River. For the purposes of this report, bedrock has been grouped as shallow, moderate depth and deep based on monitoring port elevations. Calculated groundwater potentiometric elevations are presented in **Table 2-3**.

2.8.3 Overburden Monitoring Wells

Groundwater samples were collected the week of November 6, 2023, from overburden monitoring wells SY-OBMW1 through SY-OBMW15 in accordance with Credere SOP CA-12. Wells were purged with a peristaltic pump and dedicated Teflon-lined tubing using low-flow sampling methodologies. Wells were purged at a stable flow rate between 100 and 400 mL/min. Once a stable flow rate was achieved, groundwater was monitored with a calibrated YSI MPS (see Credere SOP CA-11) with an in-line flow through cell for temperature, pH, DO, ORP, and specific conductivity, and a separate turbidity meter for turbidity. Groundwater was monitored until parameters had stabilized over a period of three readings spaced 5 minutes apart, or at a spacing sufficient to allow for a complete exchange of flow through the flow-through cell based on the flow-through cell volume and flow rate. Purging was considered complete when the following parameters were stabilized over three readings spaced 5 minutes apart according to the following criteria:

- pH: ±1 standard unit
- Temperature: ±3%
- ORP: ±10 mV
- DO: ±0.5 mg/L for values less than 2 mg/L or ±10% for values greater than 2 mg/L[1]
- Specific conductivity: ±3%
- Turbidity less than 5 NTUs or ±10% for values greater than 5 NTU

Groundwater samples were collected immediately after the pump into the appropriate laboratory provided and preserved bottleware in order of decreasing volatility. Dissolved metals samples

1 Stabilization criteria for is DO established in the QAPP (Credere, 2022); this criteria differs from Credere's SOP CA-12: Groundwater Sampling

were field filtered with an in-line 0.45-micron filter. Samples were submitted on ice to ARA and Katahdin in accordance with **Table 2-2**.

No evidence of petroleum, via PID response or the presence of free product, was observed in any monitoring wells. Purge water from SY-OBMW11 was containerized as investigation derived waste (IDW) and treated onsite through a GAC filtration drum then discharged to the ground surface. Purge water for the remaining wells was discharged to the ground surface at each monitoring well and allowed to infiltrate.

Low stress/low flow sampling logs and calibration logs are included in **Appendix E**. Sample analyses and analytical methods are summarized in **Table 2-2**. Monitoring well locations, groundwater elevations, and interpreted overburden groundwater contours for the 2023-2024 Quarter 1 groundwater sampling are depicted on **Figure 2-2**.

2.8.4 Bedrock Monitoring Wells

After a period of stabilization of at least 7 days, bedrock monitoring wells were sampled during the same mobilization as the overburden monitoring wells, the week of November 6, 2023. The Water FLUTe Systems installed in the bedrock monitoring wells (SY-BRMW1 through SY-BRMW5) use a nitrogen gas groundwater purge system that is not designed for low stress/low flow sampling. The FLUTe liner system is installed such that specific fracture zones are captured in individual FLUTe system monitoring ports, as described in **Section 2.6**. The ports were sampled using nitrogen gas and a regulator to purge water from the system. The gas line was pressurized with inert nitrogen gas to the recommended purge pressure (per the manufacturer's design) to force water into the pump tube and the sample tube to the surface. This purge was complete when gas was discharged from the sample tube following the water flow. While under positive pressure a check valve closes and isolates the sampling port tube. Each port was purged four times prior to sampling. Each port generally took about 30 minutes to 1 hour to reach the 90% minimum recharge target prior to commencing the next purge cycle. Due to the extensive bottleware necessary for the analytical suite, several additional sampling purges were generally required at each FLUTe well (in addition to the four purges required by the method) in order to fill all containers, particularly at sample locations which included QC samples (i.e., duplicates or matrix spike/matrix spike duplicate [MS/MSD]).

Groundwater samples were collected directly from the outlet tubing into the appropriate laboratory provided and preserved bottleware in order of decreasing volatility. Dissolved metals samples were field filtered with an in-line 0.45-micron filter. Sample analyses and analytical methods are summarized in **Table 2-2**. FLUTe sampling logs are included in **Appendix E**. Fifteen (15) bedrock groundwater samples were collected, placed on ice, and submitted under chain of custody to ARA and Katahdin for laboratory analysis according to **Table 2-2**.

2.8.5 Comparison of Overburden and Bedrock Monitoring Wells

One collocated overburden and bedrock monitoring well pair is present where groundwater elevations can be meaningfully compared; SY-OBMW11 and SY-BRMW1. Synoptic groundwater level gauging during the November 2023 sampling event indicated virtually identical groundwater elevations; 148.74 feet NAVD88 in SY-BRMW1 Port 1 (42-52 feet bgs), and 148.78 feet NAVD88 in SY-OBMW11. SY-OBMW11 is screened from 21-31 feet bgs. This similarity

in groundwater elevations indicates potential for a weak vertical-downward gradient. Considering the two midpoints of these screens/intervals, 47 feet bgs in BRMW1 Port 1 and 26 feet bgs in SY-OBMW11, this indicates a vertical gradient of 0.0019 vertical feet of groundwater gradient per foot of change in depth/elevation between to two measuring points.

Surface water features at the Site, depicted on **Figure 1-2**, are ephemeral drainages that only flow in response to heavy precipitation and snowmelt events. Elevation of the drainage in the southern portion of the Site near SY-OBMW12 is approximately 150 feet NAVD88; groundwater elevations in SY-OBMW12 ranged from 145.87 to 148.42 during the five measuring periods shown on **Table 2-1**, with one low point at 142.87 feet NAVD88 during a dry period. Therefore, based on water elevation measurements, groundwater discharge to Site surface water features is likely limited to periods of high groundwater conditions.

2.9 INVESTIGATION DERIVED WASTE

No observed media indicated evidence of contamination (e.g., visible petroleum, odor, elevated PID readings), and no gross contamination/saturated soil was encountered during drilling or test pitting. Therefore, no solid IDW was generated during this RI that required containerization and offsite disposal, and groundwater was discharged to the ground surface surrounding each respective boring or well (with the exception of SY-OBMW11).

Purge water for SY-OBMW11 was containerized, as TCE has historically been detected above screening criteria, and treated through a GAC drum prior to discharge to the ground surface. A treated purge water sample (GAC-110923) was collected at the end of the sampling round on November 9, 2023, and analyzed for VOCs by EPA Method 8260D to document the effectiveness of the GAC filtration. TCE was not detected in this effluent sample.

3. DATA MANAGEMENT

3.1 FIELD QUALITY CONTROL

Throughout field activities, Credere had a designated field quality control manager (QCM) and field Site Safety and Health Officer (SSHO) onsite to coordinate field tasks; to provide quality assurance (QA) oversight to ensure field procedures were consistent with the QAPP and Credere SOPs; and to ensure activities were in compliance with the project's Accident Prevention Plan (APP; Credere 2022b).

3.1.1 Field Documentation

Field documentation procedures were completed in accordance with Credere SOP CA-1. The field QCM maintained a field book to record daily events (e.g., personnel onsite, arrival and departure times, daily health and safety briefings, daily field activities, etc.), all samples collected, and all deviations from the QAPP. It was the Field QCM's daily responsibility to review the field book and field logs for accuracy and consistency, match all samples collected to sample chains of custody (COCs), and document field deviations. These events/records were summarized each day in a Daily Quality Control Report (DQCR) prepared by the Field QCM and reviewed by the Credere Project Manager for review and then transmitted to CENAE after each work day (note; DQCRs are not attached to this document). The field book and field logs were scanned for the electronic project file and field logs submitted to the Technical Lead as a final QC check.

3.1.2 Chains of Custody

Credere followed procedures outlined in Credere SOP CA-16 for COCs to ensure each sample was accounted for at all times. The objectives of the sample custody identification and control system were to ensure the following:

- Samples scheduled for collection are uniquely identified
- The correct samples are analyzed and are traceable to their records
- Samples are protected from loss, damage, or tampering
- Alteration of samples (e.g., filtration, preservation) is documented
- A forensic record of sample integrity is established

The COC form included the following:

- Sample number and sample bottle identification number, where applicable
- Names of the sampler(s) and the person shipping the samples
- Purchase order number and/or project number
- Name, telephone number, and fax number or email address of the contact person from Credere
- Project name (including specific portion of the Site if a large project)
- Signature of the sampler

- Date and time that the samples were collected
- Names of those responsible for receiving the samples and the date and time received at the laboratory
- Matrix of the sample
- The number of containers for a particular sample
- Analysis, container type, and preservative information

The field QCM reviewed COCs prior to sample submission to the laboratory for analysis.

3.2 PROJECT DATABASE

All field logs and sample documentation were uploaded to FUDSChem. The electronic QAPP (eQAPP), location IDs, and event planning was continually updated as new locations or sample changes were made based on field constraints.

Generally, the following FUDSChem steps were implemented:

1. Preparation, laboratory review, and screening check review of eQAPP. Subsequent approval and certification of the eQAPP by Credere and the USACE Chemist.
2. Event planning for planned samples prior to field mobilization.
3. Input of Chemfields within 3 days of submittal to the laboratory.
4. Preparation and input of the above field data after demobilization.

Field data was also required to be reported electronically to FUDSChem. The following was reported in FUDSChem:

- LDI prior to sampling
- LDI Update after sampling to adjust locations after sampling as well add surveyed coordinates and elevations, final depths, and diameters
- Location cross references (SLX) once the LDI was complete
- Environmental measurements (EMI) for groundwater parameters and corresponding field forms
- Groundwater levels (GWD) for groundwater gauging data and corresponding field forms
- Well construction intervals (WINT) and corresponding boring logs/well construction diagrams
- Well construction information (WCI) and corresponding well construction diagrams
- Lithology (LTD) for new soil borings and corresponding boring logs

As of the preparation of this report, field data through the 2023-2024 Quarter 1 groundwater sampling round as summarized herein was submitted to FUDSChem for review and approval.

Field data was submitted for the RI, 2023 solids event on February 24, 2023, and for the Groundwater November 2023 event on November 16, 2023.

Electronic data deliverable (EDD) files to meet Maine DEP EDD submittal requirements for upload into the Maine DEP Environmental and Geographic Analysis Database (EGAD) were exported from FUDSChem and will be provided to Maine DEP concurrent with finalization of this report. Field data was also tabulated in EGAD format for Maine DEP submittal.

4. ANALYTICAL DATA TRANSMITTAL

The following sections serve as a data transmittal and opinion of usability for analytical results. The final interpretation of these results is reserved for future reporting when four quarters of data have been collected for the bedrock groundwater, at which time eight quarters of data will be available for overburden groundwater results.

Laboratory analytical results were received from ARA of Portsmouth, New Hampshire, for the following methods:

- EPA method 8260D for VOCs
- EPA method 8270E for semi-volatile organic compounds (SVOCs)
- EPA method 6020A for metals with EPA 7470A for mercury
- Massachusetts Department of Environmental Protection (MassDEP) volatile petroleum hydrocarbons (VPH)-04-1.1
- MassDEP extractable petroleum hydrocarbons (EPH)-04-1.1
- EPA method 8082A for polychlorinated biphenyl (PCB) Aroclors

The following methods were analyzed by KAS of Scarborough, Maine:

- EPA method 7196A for hexavalent chromium
- EPA method 8270D with selective ion monitoring (SIM) for polycyclic aromatic hydrocarbons (PAHs)
- EPA method 8260C with SIM for CVOCs
- Total Organic Carbon (TOC) by Lloyd Kahn or EPA method A5310B
- EPA method 300 for anions
- EPA method RSK-175 for dissolved gases
- EPA method A3500-Fe B for ferrous iron
- EPA method 2320B for alkalinity

Samples collected in November 2023 as part of the Quarter 1 groundwater sampling event of the Data Gap Phase are summarized in **Table 2-2**, which indicates the completed analytical method lists. Analytical results are tabulated in **Table 4-1** for soil samples, **Table 4-2** for overburden monitoring wells, and **Table 4-3** for bedrock monitoring wells. **Appendix F** contains the final laboratory reports from ARA and Katahdin for the Quarter 1 groundwater sampling event. Preliminary screening levels are included in the table and results equal to or exceeding these screening criteria are highlighted accordingly.

Staged electronic data deliverables (SEDDs) for the first quarterly groundwater sampling results were loaded to FUDSChem between January 3 and January 9, 2024.

4.1 ANALYTICAL RESULTS OVERVIEW

This section discusses the results of soil samples collected during the installation of one replacement overburden groundwater monitoring well and the results of overburden and bedrock groundwater samples which is the primary focus of this work and report.

4.1.1 SY-SB4R Soil Results

Three soil samples were collected from the replacement well boring (SY-SB4R); two samples from 0.5-2 feet bgs (a parent sample and a duplicate), and one sample from 2-4 feet bgs. Results for these samples are included in **Table 4-1** along with the soil analytical results from previous borings.

Soil results in **Table 4-1** are compared to the project action limits (PALs), which are the lowest of the following human health and ecological screening levels:

- Human health screening levels:
    - EPA Regional Screening Levels (RSLs) for soil for the residential (unrestricted) exposure scenarios at a hazard quotient (HQ) of 0.1 or an excess lifetime cancer risk (ELCR) of $1x10^{-6}$ (EPA, 2021)
    - Maine DEP Remedial Action Guidelines (RAGs) for Sites Contaminated with Hazardous Substances (Maine DEP, 2023). RAGs were adjusted to represent $1x10^{-6}$ ELCR to be consistent with the above regional screening levels. RAGs are provided for informational purposes only and are only used as primary screening values for MassDEP EPH and VPH fractions.

- Ecological screening levels:
    - EPA Interim Ecological Soil Screening Level (EcoSSL) Documents (EPA, 2016)
    - Soil-based toxicity benchmarks for plants and soil invertebrates developed by the Department of Energy (DoE; Sample et al. 1996, 1998a, 1998b)

Note that the RSLs and EcoSSLs are the PALs, while the RAGs are included for relative comparison.

Maine statewide background upper prediction limits (UPLs) and the Site-specific background data are included in the tables; however, an evaluation of results relative to background is not included herein. A background evaluation will be completed as part of risk assessment/data gap screening in the RI report. Further evaluation of this data will be deferred to that report.

The following compounds were detected above the screening criteria for soil in SY-SB4R:

- Benzo(a)pyrene exceeding the PALs from 0.5-2 feet bgs
- Metals (aluminum, antimony, arsenic, chromium, cobalt, iron, lead, manganese, nickel, selenium, thallium, vanadium, and zinc) exceeding the PALs (RSL and/or EcoSSL) from both sample depths (0.5-2 and 2-4 feet bgs). Hexavalent chromium exceeding the PAL from 2-4 feet bgs

The following groups of compounds had detected analytes but were below the referenced screening criteria in the SY-SB4R samples:

- EPH
- VPH
- VOCs

Further, there were no detections at the limit of detection (LOD) for the following analyte lists:

- PCBs
- SVOCs

4.1.2 Groundwater Results

During the November 2023 sampling event, 30 primary samples (not including QC samples, i.e., duplicates and MS/MSDs), were collected. This included 15 bedrock groundwater samples and 15 overburden/hybrid well groundwater samples. Groundwater analytical results are presented in tables that compare results by shading to the following human health screening levels:

- EPA Tapwater RSLs (EPA, 2021) for comparison to groundwater results.
- EPA Maximum Contaminant Levels (MCLs; EPA, 2021), where established, for comparison to groundwater results.
- Maine DEP RAGs for Sites Contaminated with Hazardous Substances (Maine DEP, 2021). RAGs were adjusted to represent $1x10^{-6}$ ELCR to be consistent with the above regional screening levels. RAGs are provided for informational purposes only and are only used as primary screening values for MassDEP EPH and VPH fractions.

Based on the depth to groundwater, ecological screening for groundwater is not applicable at this Site.

Overburden Groundwater Results

Table 4-2 presents cumulative analytical results for overburden groundwater sampling during RI activities from 2019 to present. Results discussed below are the new results from the November 2023 sampling event only.

Generally, one or more of the following compound/analyte concentrations were detected above the screening criteria for groundwater:

- Metals – arsenic, cobalt, and manganese
- CVOCs – TCE and VC
- SVOCs – bis(2-Ethylhexyl) phthalate (DEHP or BEHP) and bis(2-chlorethoxy) methane

EPA RSLs divide petroleum hydrocarbons to low, medium, and high aliphatics and aromatics. In the absence of RSLs for the specific EPH and VPH petroleum carbon fractions (i.e., C11-C22 aromatics, C19-C15 aromatics), Maine RAGs where available were used as the PAL. Detected concentrations of C11-C22 aromatics exceed the PAL, while all other fractions were not detected or detected below the PAL.

The following analyte lists had no detections at the LOD:

- VOCs (other than CVOCs)
- PAHs
- PCBs
- EPH target compounds
- VPH target compounds and petroleum fractions

The following paragraphs discuss chemical results related to the geophysical conductive anomaly, the occurrence of chlorinated solvents in groundwater, and the detection of DEHP (also known as BEHP).

Generally, results are consistent with prior sampling results for most detected analytes. Chloride and sulfate are elevated in SY-OBMW4R consistent with prior results of several wells including SY-OBMW4, SY-OBMW7 and SY-OBMW15 suggesting that geophysical conductive anomaly is an artifact of road de-icing or de-icing salt storage during historical operations.

The VOC SIM data indicates TCE in SY-OBMW11 is consistent with past detections. The SIM data also reveals the presence of low levels of 1,1-Dichloroethene and cis-1,2-Dichloroethene from biodegradation (reductive dechlorination) of TCE. Analysis of CVOCs by SIM during this round identified concentrations of CVOCs above the PAL (residential RSL) in SY-OBWM11 consistent with prior rounds, but also in SY-OBMW12, which had only one prior TCE exceedance in August 2020, and SY-OBMW14. Both of these wells with exceedances also had detections of vinyl chloride above the PAL (tapwater RSL).

DEHP was also detected in certain November 2023 samples at concentrations that are elevated relative to the low solubility reported for this compound. DEHP water solubility in literature is reported over a wide range from low parts per million to low parts per billion and the reported concentrations are near or above literature values of solubility which would require presence of a non-aqueous phase liquid (NAPL). Similar detections occurred in March 2020 in several wells, but those results were not verified by other sampling rounds. DEHP density is slightly less than water which means it is a light NAPL (LNAPL) with higher viscosity than most NAPLs since it is a plasticizer. Discussion with the laboratories did not identify a laboratory source (including non-USACE samples in the analytical sequence) so any conclusions regarding these detections should be deferred until they can be verified by additional sampling.

Bedrock Groundwater Results

Table 4-3 presents the analytical result for bedrock groundwater during this period (November 2023 sampling). This is the first sampling event for bedrock groundwater.

The following compound/analyte concentrations were detected above the screening criteria for groundwater:

- PAHs – benzo(a)anthracene and benzo(a)pyrene in two wells, and dibenzo(a,h)anthracene and benzo(b)fluoranthene in one well.
- Metals – antimony, arsenic, cobalt, mercury, and manganese
- VOCs – chloroform, TCE, and VC
- SVOCs – bis(2-chloroethoxy) methane and DEHP

EPA RSLs divide petroleum hydrocarbons to low, medium, and high aliphatics and aromatics. In the absence of RSLs for the specific EPH and VPH petroleum carbon fractions (i.e., C11-C22 aromatics, C19-C15 aromatics), Maine RAGs where available were used as the PAL. Detected concentrations of C11-C22 aromatics exceeded the PAL in one sample. This was an estimated concentration below the LOD. The remaining LODs exceeded the PAL.

The following groups of compounds/analytes were detected in the collected groundwater samples at concentration below the referenced screening criteria:

- VPH – toluene was detected in all wells and ports but is assumed to be diffused from the FLUTe liners, as discuss in the FLUTe FACT Data Report with Transmissivity Profiles report (FLUTe, 2023).
- Other VOCs
- Other phthalates

The following analyte lists had no detections at the LOD:

- VPH petroleum fractions
- EPH target compounds
- Hexavalent chromium
- PCBs

The following paragraphs discuss chemical results related to chlorinated solvents in bedrock groundwater, which is the primary focus of this Data Gap Phase investigation, as well as the detection of DEHP.

Similar to overburden, the VOC SIM data indicates TCE at low concentrations but also the presence of low levels of trans-1,2-dichloroethene (trans-DCE) and vinyl chloride (VC) from degradation of TCE and depending on the well location some reported concentrations exceed PALs (tapwater RSLs). The distribution of these compounds is presented in figures in **Section 5**.

Other detected VOCs include tetrahydrofuran and toluene. Toluene is a known artifact of the FLUTe liners. Chloroform was detected above the PAL (tapwater RSLs) in two wells but its presence should be confirmed by subsequent sampling events.

The bedrock groundwater data also detected the presence of DEHP at concentrations that are elevated relative to the low solubility reported for this compound. Per the discussion of similar overburden groundwater results any conclusions regarding these detections should be deferred until they can be verified by additional sampling.

4.2 DATA VALIDATION AND USABILITY

Validation of the SY-SB4R soil sampling event and the November 2023 groundwater sampling event was completed by Laboratory Data Consultants (LDC) of Carlsbad, California, and EnSafe, Inc. (EnSafe) of Mount Pleasant, South Carolina, respectively. Validated results have been incorporated into the attached **Tables 4-1 through 4-3**. Copies of the validation reports for SY-SB4R and Quarter 1 – November 2023 events, as well as the data usability assessment, are included in **Appendix G**.

LDC/EnSafe completed the Stage 2A validation through a combination of Automated Data Review (ADR) software internal to FUDSChem and supplemental manual review based on professional judgment. A project chemist reviewed the QC elements associated with each sample delivery group (SDG) in accordance with the QAPP (Credere, 2022).

Stage 2a level data validation review consisted of: 1) sample identification, preservation, and holding time verification; 2) surrogate, laboratory control sample/laboratory control sample duplicate (LCS/LCSD), and MS/MSD recoveries; 3) LCS/LCSD, MS/MSD, and field duplicate precision; 4) method and field blank contamination issues; and 5) sensitivity of reported results compared to the eQAPP and QAPP requirements.

Data validation reports were then reviewed by the Credere project chemist and technical lead prior to finalization and submittal for USACE review and approval in FUDSChem.

4.2.1 SY-SB4R Soil Event

The following general trends in qualification were encountered in the SY-SB4R soil sampling data set and their impact on the usability of results is summarized below:

- Hexavalent chromium was analyzed outside the hold time due to hood failure at the laboratory and inability to safely extract the samples. These results have been qualified as estimated. Based on results generally consistent with other nearby locations (SY-SB4), these qualifications do not impact the usability of these results.
- Detections in various blank samples (mainly method blanks) for EPH, VPH (mainly for the petroleum fractions), metals, and VOCs resulted in qualification of associated sample results as ‘U’ at the limit of quantification (LOQ) or as estimated concentrations with a potential false positive (J). Qualifications were reviewed and the LOQ or detected concentrations sufficiently met/were below the sensitivity goals. As these qualifications were applied to trace concentrations, the usability of the data is not considered impacted.

- Surrogate, laboratory control sample (LCS)/laboratory control sample duplicate (LCSD), and matrix spike (MS)/matrix spike duplicate (MSD) recovery nonconformances resulted in qualifications of associated results as estimated with bias (J or UJ).

The following were recommended for exclusion (X) during validation:

- The SVOC results for analytes 2,4-dinitriphenol and benzidine for samples SY-SB4R-1, SY-SB4R-10 (duplicate), and SY-SB4R-2 were recommended for exclusion based on LCS and MS percent recovery below the eQAPP lower rejection limit of 20%. The associated results were non-detect and have been rejected (R). Based these analytes not being contaminants of interest for the Site based on historical soil results sitewide, this rejection does not impact the overall usability of the larger data set.

In total, 0.58% of results were rejected (4 of 689 total results) indicating 99.56% of result are usable for RI purposes. Rejected analytes were not COPCs; therefore, completeness for the COPCs is 100%. Data usability assessment (DUA) was performed using the FUDSChem module. A copy of the DUA report is provided in **Appendix G**. Considering the results of this report, the data collected as part of the SY-SB4R soil sampling event are usable for making project decisions relative to the established objectives unless rejected.

4.2.2 November 2023 Groundwater Event

- Several VOC analyte detected results were qualified as estimated (J) due to an air bubble in samples SY-BRMW5-29-44-110823. These results will be confirmed during subsequent quarters in this FLUTe port to assess the impact of this air bubble on the results.
- Chlorinated solvents have emerged as the primary contaminant of interest for Site groundwater. These analytes have been further analyzed by an 8260 SIM method, which provides lower detection limits for improved data quality during this November 2023 sampling round. As a result, additional analytes were detected from this list that were not detected by the standard 8260 method in wells SY-OBMW8, SY-OBMW11, SY-OBMW12, and SY-OBMW14. It is likely these analytes were always present but were not detected in the standard 8260 scan. These results will be specifically reviewed during subsequent sampling rounds for representativeness. Despite the SIM method, the VC limit of detection (LOD) remains above the PAL. This is considered acceptable since the result is already a SIM method.
- The lower detection limits afforded by the SW8260C SIM method compared to standard SW8260C/SW8260D provide an improved understanding of the distribution of relatively low concentrations of CVOCs in the groundwater system. In the standard SW8260D method, the concentrations of TCE daughter products, including VC, were all below reporting limits.
- Detections in various blank samples (mainly method blanks) for EPH, VPH, VOCs, metals, gases (methane), and hexavalent chromium resulted in qualification of associated sample results as ‘U’ at the LOQ or as estimated concentrations with a potential false positive (J). Qualifications were reviewed and applied only to MNA parameters or analytes with no PALs. As this qualification was applied to trace concentrations, the usability of the data is not considered impacted.

- Surrogate, LCS/LCSD, and MS/MSD recovery nonconformances resulted in qualifications of associated results as estimated with bias (J or UJ). These qualifications do not affect the usability of the results relative to the objectives.

The following were recommended for exclusion (X) during validation:

- The PCB results for SY-OBMW4R-1107-23 were recommended for exclusion based on LCS percent recovery below the eQAPP lower rejection limit of 20% due to spilled sample in the lab. The associated results were non-detect and have been rejected (R). Based these analytes not being contaminants of interest for the Site and having been non-detect for all other sampled rounds in SY-OBMW4, this rejection does not impact the overall usability of the data set. Results will be specifically reviewed to confirm PCB results remain non-detect in SY-OBMW4R replacement well for subsequent quarters.
- The EPH C9-C18 aliphatics result for sample SY-BRMW10-65-75-110923 was recommended for exclusion based on LCS/LCSD percent recovery below the eQAPP lower rejection limit of 20%. The associated result has been rejected (R). As this sample was a duplicate, results of the parent sample, analyzed in a separate, acceptable batch, can be used for decision making. Therefore, this rejection does not impact the overall usability of the data set.
- The SVOC benzoic acid results for samples SY-BRMW-10-65-75-110923,SY-BRMW1-150-157-110923, SY-BRMW1-42-52-110923, SY-BRMW1-65-75-110923, SY-BRMW3-145-155-110923, SY-BRMW3-287-297-1109-23, SY-BRMW4-291-301-110923 were recommended for exclusion based on LCS/LCSD percent recovery below the eQAPP lower rejection limit of 20%. The associated results were non-detect and have been rejected (R). As these analytes are not contaminants of interest for the Site based on historical groundwater results sitewide, this rejection does not impact the overall usability of the data set. Additionally, hexachloroethane had an LCSD percent recovery below the lower rejection limit; however, as the LCS was in control, associated samples were qualified as UJ and not rejected. Further, some samples with percent recovery below the LRL were not rejected by using the DoD module 1 lower rejection limit of 10% for benzoic acid, hexachloroethane, and phenol. These results were qualified as non-detected estimated (UJ).

In total, 0.13% of results were rejected (7 of 5,578 total results) indicating 99.95% of results are usable for RI purposes. Rejected analytes were not COPCs; therefore, completeness for the COPCs is 100%.

All final laboratory reports for November 2023 were uploaded to FUDSChem by January 9, 2024. Validation was initiated immediately and was completed by EnSafe by February 5, 2024. DVRs were reviewed and approved by Credere for loading to FUDSChem by February 15, 2024, and DVRs and lab reports were approved as final in FUDSChem by USACE on April 23, 2024.

A DUA was performed using the FUDSChem module. A copy of the DUA report is provided in **Appendix G**. Considering the results of this report, the data collected as part of the November 2023 sampling event are usable for making project decisions relative to the established objectives.

5. SUMMARY

The objective of the bedrock groundwater characterization and continued monitoring of overburden groundwater was to fill any data gaps concerning the presence and nature and extent of VOCs in groundwater that was initially triggered by the detection of TCE in SY-OBMW11 at concentrations just above the MCL. This section summarizes the nature and extent of chlorinated solvents in overburden and fractured bedrock groundwater, addresses recommendations for future well maintenance and concludes on the existence of any remaining data gaps. Note that this section is limited to the first of four quarterly groundwater sampling events, as well as the soil sample collected during the installation of replacement overburden well SY-OBMW4R.

5.1 SY-SB4R SOIL SAMPLING

Concentrations in soil samples collected from replacement overburden boring SY-SB4R exceeded the PALs in several instances, including benzo(a)pyrene from 0.5-2 feet bgs; aluminum, antimony, arsenic, chromium, cobalt, iron, lead manganese, nickel, selenium, thallium, vanadium and zinc and from 0.5-2 and 2-4 feet bgs, and hexavalent chromium from 2-4 feet bgs. These results are consistent with prior discrete and incremental sampling methodology (ISM) sample results throughout the Site.

Additionally, analytical results from 2-4 ft bgs indicated substantially higher sodium concentrations than anywhere else onsite. Consistent with prior interpretation of groundwater results, this is believed to indicate the conductivity anomaly is the result of historical deicing salt (NaCl) stored/used at the Site.

5.2 NATURE AND EXTENT OF CHLORINATED SOLVENTS IN GROUNDWATER

The deep overburden/hybrid well network monitors a confined system of deep overburden/shallow bedrock groundwater contained within weathered bedrock. Transducer data collected during bedrock well drilling and development show the shallow groundwater system to be well connected to underlying confined bedrock groundwater system. Groundwater drilling resulted in Site-wide drawdown of bedrock groundwater with a well-developed northeast – southwest anisotropy with a ratio of approximately 3:1 indicating under pumping conditions bedding plane and bedding parallel fractures were dominant and better connected. Under ambient or non-pumping conditions groundwater flow directions are consistently southeast in all units. This suggests, that bedrock groundwater flow is controlled by an interconnected network of regional joints and bedding plane or bedding parallel fractures. Vertical gradients in bedrock are downward overall, although intermediate depth bedrock groundwater shows some well specific gradient reversals that reflect different head conditions in the fracture network. Whether these gradient reversals are a function of isolated fractures having different spatial connections in the aquifer or a general zone of convergence of shallow and deeper groundwater toward the intermediate depth interval in the aquifer is not known. Such gradient reversals in boreholes are, however, not uncommon and undue emphasis on them is likely not warranted here. The presence of an overall downward groundwater vertical gradient in bedrock is consistent with a regional CSM of groundwater flow in overburden and bedrock that is toward discharge points along the Penobscot River which is tidally influenced in the Bangor area. The downward bedrock gradients would be expected to reverse becoming upward along the immediate margins of the river system, where it is likely that shallower and

intermediate depth groundwater may seek to discharge to the river system. Groundwater not captured by the river system would underflow toward discharge points along the Atlantic coastline in Penobscot Bay.

A summary table of VOCs detected in groundwater and comparison to screening values is presented in **Table 4-2** (overburden) and **Table 4-3** (bedrock). Groundwater potentiometric contour maps indicating a southeasterly direction of groundwater flow are presented for overburden / hybrid wells in **Figure 2-2**; and for the shallow, moderate depth and deep bedrock intervals in **Figure 2-3a**, **2-3b**, and **2-3c**, (Zones 1, 2 and 3) respectively.

A composite contoured figure of the distribution of TCE, trans 1,2 DCE and VC in overburden /hybrid wells which includes some shallow weathered bedrock is presented in **Figure 5-1.** A similar figure for the combined FLUTe data for shallow, moderate depth and deep bedrock groundwater is presented in **Figure 5-2**. The number, magnitude and distribution of these chlorinated compounds did not warrant separate figures for different bedrock depths. **Figure 5-1** indicates a plume of TCE with a source in the vicinity of SY-OBMW11 with decreasing concentrations downgradient in SY-OBMW12 and SY-OBMW14. Downgradient concentrations are slightly above PALs (tapwater RSLs). Other reductive dechlorination biological degradation products are also present near the source and downgradient including trans 1,2, DCE, at concentrations below PALs (tapwater RSLs). VC, which is also a degradation product, eventually appears in the downgradient extent of the plume in SY-OBMW14 at a concentration slightly above the PAL (tapwater RSL). This pattern is consistent with the first order decay of TCE to DCE and subsequently VC with time along the groundwater flow path. Note that the above discussion only includes compounds which were detected and there is no discussion of non-detect compounds.

Figure 5-2 shows a similar distribution of TCE and daughter products trans-1,2-DCE and VC in bedrock though the extent of the plume is broader and more diffuse. TCE was detected above its PAL (tapwater RSL) in two bedrock intervals, from 150-157 ft bgs in SY-BRMW-1 and the 123-133 foot interval in SY-BRMW5. These detected concentrations are highest in SY-BRMW-1, adjacent to SY-OBMW11, and lower down gradient. TCE was also detected in shallower depth intervals in SY-BRMW1 and in the intermediate depth interval (138-148 feet) and deeper interval (291-301 feet) in SY-BRMW4. In all cases these detections are below the PALs (tapwater RSLs). VC was detected in all three ports in SY-BRMW3 at concentrations just above the PAL (tapwater RSL). Trans 1,2 DCE was also present in the deep interval in SY-BRMW3 with the VC.

The detections of TCE in SY-BRMW5 (123-133 feet) is not associated with any detections of DCE or VC, and in this regard is distinct from detections in other wells to the west and southwest. The fracture zone in which TCE is present in SY-BRWM5 is within a fault zone and dip azimuths of the feature with the largest aperture are upward at a shallow angle toward the general vicinity of SY-BRWM1.

5.3 WELL MAINTENANCE RECOMMENDATIONS

If necessary, future overburden well maintenance may be considered if the monitoring wells are planned to be maintained for any ongoing long-term monitoring subsequent to this RI, or future remedial efforts (if any). At the time of the Quarter 1 groundwater sampling event, all overburden well protective casings and road boxes, where present, were documented in good and acceptable

physical condition, and all newly installed bedrock monitoring wells finished with FLUTe systems were also in good condition. All wells appeared in acceptable conditions, with the exception of SY-OBMW7, which showed measurable indications of sediment accumulation based on depth to the bottom of the well measurements shown in **Table 2-1**. Each well was constructed with a 2-foot sump below the bottom of the screen. Water quality samples have not been affected by the sediment accumulation based on water quality parameter measurements and analytical data results. Although this well has been redeveloped, repeated purging to remove accumulated sediment should be evaluated in the future if the well performance indicates a reduction in specific capacity. Note SY-OBMW7 has never detected organic chemicals except one detection of low estimated concentrations of EPH (C11-C22 aromatic fraction).

Future well development recommendations would be based on water quality changes and well hydraulic performance which is monitored by computing specific capacity from low stress/low flow sampling data and tabulated in **Table 2-1**. The initial well development between the December 2020 sampling round and the November 2023 round indicated 1 order of magnitude improvement in two wells (SY-OBMW12 and SY-OBMW14), with most wells being unchanged.

5.4 DATA GAP EVALUATION

Based on the distribution of chlorinated solvents and their respective concentrations presented in **Figure 5-1** and **Figure 5-2**, the nature and extent of TCE, DCE and VC are well delineated both horizontally and vertically within the overburden and fractured bedrock aquifer. Overburden CVOC concentrations are low and would not appear to pose a concern for vapor encroachment on adjoining properties if the plume extent even reached that far. In accordance with the QAPP, a formal assessment of potential vapor encroachment on the downgradient commercial properties will be conducted after the second round of groundwater data has been evaluated. Therefore, the QAPP objectives have been met, and no data gaps are present, based on this round of data, with respect to these compounds.

Several detections of PAHs above the PALs (tapwater RSLs) occurred in shallow interval of SY-BRMW1 and SY-BRMW2. In bedrock several metals also exceed PALs (tapwater RSLs) including arsenic. As discussed previously, the reported detection of DEHP is enigmatic based on compound solubilities and should be corroborated by additional sampling. When all four rounds of groundwater are completed and results interpreted, the data set will be sufficient to define the plume core, develop a list of COPCs, calculate exposure point concentrations, and complete a human health risk assessment for groundwater.

ELEVATIONS COMPUTED FROM GEOID 18 BASED ON TWO PERMANENT BENCHMARKS INSTALLED AND OBSERVED IN NOVEMBER 2020, UPON WHICH AN OPUS SOLUTION WAS OBTAINED AND THREE WIRE LEVELS WERE RUN. DECEMBER 2020 POSITIONS RECORDED DURING RESURVEY BY PSILGA & DAY LAND SURVEYORS, AUGUST 10-12, 2020, AND NOVEMBER 9-20, 2020. SY-OBMW4R AND BEDROCK MONITORING WELL DATA RECORDED BY PLISGA & DAY LAND SURVEYORS USING THE SAME METHODOLOGY, ON JANUARY 4 & 24, 2024.

Notes:
bgs - below ground surface
BTOR - below top of riser
ft/s - feet per second
NAVD88 - North American Vertical Datum of 1988
1 - Gauging data collected during a single synoptic round of measurements during groundwater sampling activities, on November 6, 2023.
2 - Screened interval data taken from boring logs recorded during soil boring/well installation activities.
3 - Elevations recorded by Psilga & Day Land Surveyors, November 15-22, 2019. Elevations reference the North American Vertical Datum of 1988 (NAVD88) using GPS tied to the NGS CORS Network (via Maine Department of Transportation VRS GPS control network). Elevations computed from GEOID 18 based on two permanent benchmarks installed and observed in November 2020, upon which an OPUS solution was obtained and three wire levels were run. December 2020 positions recorded during resurvey by Psilga & Day Land Surveyors, August 10-12, 2020, and November 9-20, 2020. SY-OBMW4R data recorded by Plisga & Day Land Surveyors using the same methodology, on January 4 & 24, 2024.
4 - Hydraulic conductivity calculated using Bouwer & Rice Method (1976) and based on field work performed in December 2019 with the exception of SY-OBMW6, which was assessed in March 2020.
5 - Specific Capacity tests conducted during well development the week of June 20, 2022, and on February 7, 2023 (SY-OBMW4R only), or calculated based on purge data during groundwater sampling conducted the week of November 6, 2023. Four tests were completed during development; 1 at the beginning of development activities (baseline), 2 during development (after surging and recharging), and 1 at the end of development.

Table 2-2
Sample Summary Table Field Guide
Former Salvage Yard (D01ME00407), Former Dow Military Airfield
233 Odlin Road, Bangor, Maine

Notes

*Samples contingent on Site conditions. Conditions warranting collection indicated under Target Depth/Methodology.

^Samples collected from the midway point of the screen, installed straddling the apparent water table (at time of drilling, for overburden wells). For bedrock wells, summary is shown for the interval selection based on the suspected presence of hydrualically active fractures (based on heat pulse flow meter response).

1 - One metals aqueous sample at each location was unfiltered for total metals, and one was field filtered for dissolved metals analysis

FD - field duplicate

MS/MSD - matrix spike/matrix spike duplicate

Blue indicates groundwater samples

Table 4-1
Discrete Soil Sample Summary of Analytical Results
Former Dow Salvage Yard
233 Odlin Road, Bangor, Maine

NOTES:

1 - U.S. EPA Regional Screening Levels, (ELCR 1x10-6, HQ 0.1), Residential, May 2021

2 - Maine Department of Environmental Protection Remedial Action Guidelines (RAGs) lowest of exposure scenarios, November 15, 2023, provided for information purposes only.

3 - Background values Maine DEP UPLS from RAGs, or Summary Report for Evaluation of PAHs and metals in Background Soils in Maine (November 2012)

4 - Ecological screening values lowest of a. and b. below

a. EPA Interim Ecological Soil Screening Levels (EcoSSLs)

b. Soil based toxicity benchmarks for plants and soil invertebrates developed by DOE

Detects are displayed in bold font

Results exceed residential RSL

Results exceed only ecological screening levels

Results exceed residential RSL but are consistent with background

Reported lab limit exceeds screening criteria

For EPH and VPH fraction results, only adjusted results are presented.

NE - not established

† - hexavalent chromium criteria

Data Qualifier Definitions

U - The analyte was not detected and was reported as less than the LOD or as defined by the customer. The LOD has been adjusted for any dilution or concentration of the sample.

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

UJ - The analyte was not detected and was reported as less than the LOD or as defined by the customer. However, the associated numerical value is approximate.

Units

PERCENT = percent

PPT = parts per thousand

ug/kg = microgram per kilogram

ug/L = microgram per liter

mg/L = milligram per liter

mg/kg = milligrams per kilogram

Analyses

PAH - polycyclic aromatic hydrocarbons

SIM - selective ion monitoring

EPH - extractable petroleum hydrocarbons

VPH - volatile petroleum hydrocarbons

MassDEP - Massachsuetts Department of Environmental Protection

PCBs - polychlorinated biphenyls

VOC - volatile organic compounds

SVOCs - semi-volatile organic compounds

LOD - limit of detection

Table 4-2
Cumulative Summary of Overburden Groundwater Analytical Results
Former Dow Salvage Yard
233 Odlin Road, Bangor, Maine

NOTES:

1 - U.S. EPA Regional Screening Levels, Tapwater (ELCR 1x10-6, HQ 0.1), November 2021

2 - U.S. EPA Maximum Contaminant Levels, May 2021

3 - Maine Department of Environmental Protection Remedial Action Guidelines (RAGs) lowest of exposure scenarios, November 15, 2023

Detects are displayed in bold font

Results exceed RSL

Reported lab limit exceeds screening criteria

For EPH and VPH fraction results, only adjusted results are presented.

NE - not established

† - hexavalent chromium criteria

Data Qualifier Definitions

U - The analyte was not detected and was reported as less than the LOD or as defined by the customer. The LOD has been adjusted for any dilution or concentration of the sample.

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

UJ - The analyte was not detected and was reported as less than the LOD or as defined by the customer. However, the associated numerical value is approximate.

Units

PERCENT = percent

PPT = parts per thousand

ug/kg = microgram per kilogram

ug/L = microgram per liter

mg/L = milligram per liter

mg/kg = milligrams per kilogram

Analyses

PAH - polycyclic aromatic hydrocarbons

SIM - selective ion monitoring

EPH - extractable petroleum hydrocarbons

VPH - volatile petroleum hydrocarbons

MassDEP - Massachsuetts Department of Environmental Protection

PCBs - polychlorinated biphenyls

VOC - volatile organic compounds

SVOCs - semi-volatile organic compounds

Table 4-3
Cumulative Summary of Bedrock Groundwater Analytical Results
Former Dow Salvage Yard
233 Odlin Road, Bangor, Maine

NOTES:

1 - U.S. EPA Regional Screening Levels, Tapwater (ELCR 1x10-6, HQ 0.1), November 2021

2 - U.S. EPA Maximum Contaminant Levels, May 2021

3 - Maine Department of Environmental Protection Remedial Action Guidelines (RAGs) lowest of exposure scenarios, November 15, 2023

Detects are displayed in bold font

Results exceed RSL

Reported lab limit exceeds screening criteria

For EPH and VPH fraction results, only adjusted results are presented.

NE - not established

† - hexavalent chromium criteria

Data Qualifier Definitions

U - The analyte was not detected and was reported as less than the LOD or as defined by the customer. The LOD has been adjusted for any dilution or concentration of the sample.

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

UJ - The analyte was not detected and was reported as less than the LOD or as defined by the customer. However, the associated numerical value is approximate.

Units

PERCENT = percent

PPT = parts per thousand

ug/kg = microgram per kilogram

ug/L = microgram per liter

mg/L = milligram per liter

mg/kg = milligrams per kilogram

Analyses

PAH - polycyclic aromatic hydrocarbons

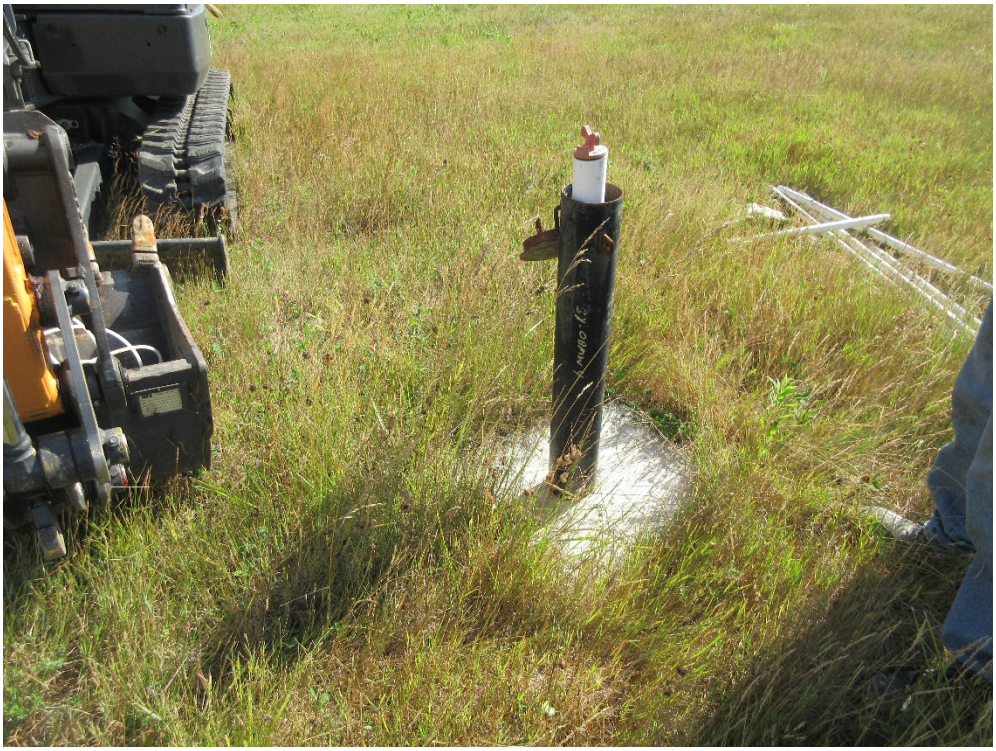
SIM - selective ion monitoring

EPH - extractable petroleum hydrocarbons

VPH - volatile petroleum hydrocarbons

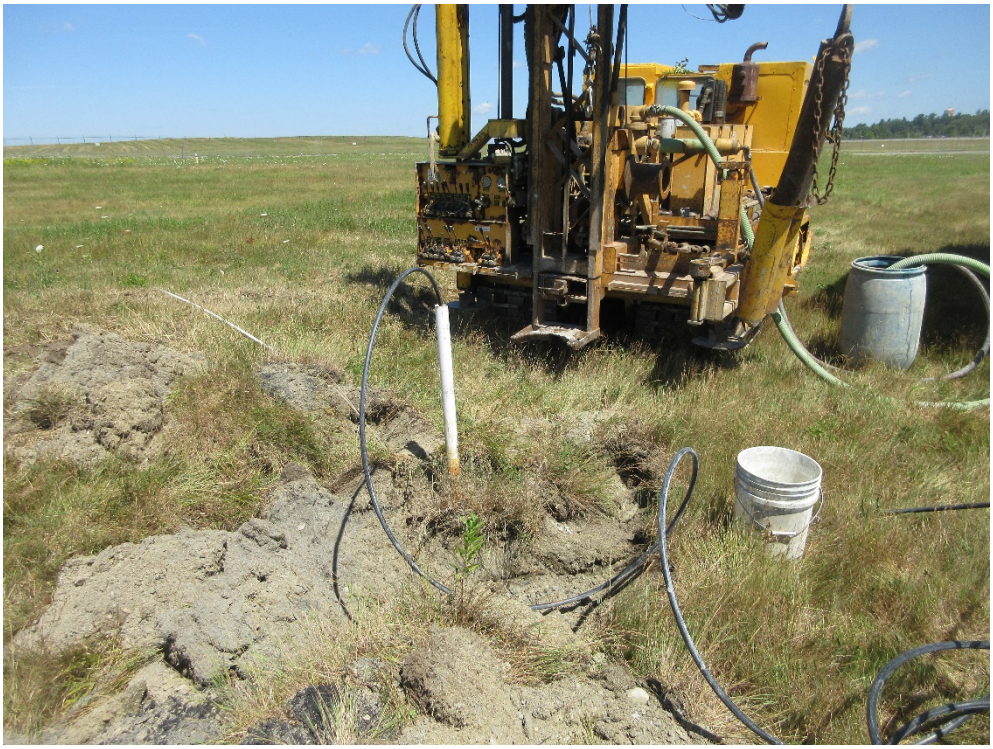
MassDEP - Massachsuetts Department of Environmental Protection

PCBs - polychlorinated biphenyls



VOC - volatile organic compounds

SVOCs - semi-volatile organic compounds



APPENDIX A

PHOTO LOG

Appendix A – Data Gap Assessment Photo Log
Former Salvage Yard (D01ME00407), Former Dow Military Airfield
233 Odlin Road, Bangor, Maine

1. SY-OBMW4 prior to abandonment; heaved riser visible above protective casing.

2. SY-OBMW4 during abandonment; hose for tremie grouting visible.

Appendix A – Data Gap Assessment Photo Log
Former Salvage Yard (D01ME00407), Former Dow Military Airfield
233 Odlin Road, Bangor, Maine

3. Photo showing the ~6” drain hole cut into each replacement protective casing, which drained into the gravel pad at each well.

4. Photo showing the 2’x2’x2’ steel cube filled with gravel, fabricated to facilitate the installation of the specified size gravel pads.

Appendix A – Data Gap Assessment Photo Log
Former Salvage Yard (D01ME00407), Former Dow Military Airfield
233 Odlin Road, Bangor, Maine

5. Photo of a replacement protective casing at one well after installation.

6. Photo showing grain size of the gravel used in the replacement overburden well pads.

7. View of foliation plane orientations (218° Dipping 80°N) at outcrop near the Alert Building, northwest of the Site, observed during the Integrated Fracture Trace study.

8. View showing dense-high frequency foliation planes in outcrop along I-95 Highway South. Trending 228°; Dipping 60°. Based on planar orientation, these features likely intersect the Eurovia Quarry to the northeast of this outcrop location. This location was selected for feature density transect with a measured frequency of 46 features per 90 feet thickness (1.95 feet/ fracture), observed during the Integrated Fracture Trace study.

9. View showing water bearing hinge within Z-type folds, similar to those depicted in the previous photo. Due to mine safety procedures, field crew were not permitted to stand in proximity to quarry wall and collect direct measurements or place GPS receiver. Width of wetted fold axis ~10-15 feet across. Observed during the Integrated Fracture Trace study.

10. View showing example of a minor fault feature within the Eurovia Quarry wall. These types of features are interpreted to be not laterally continuous, but perhaps may interconnect. Observed during the Integrated Fracture Trace study.

Appendix A – Data Gap Assessment Photo Log
Former Salvage Yard (D01ME00407), Former Dow Military Airfield
233 Odlin Road, Bangor, Maine

11. View showing the large fault feature observed at bottom of Eurovia Quarry near elevation of ~0 feet NAVD88. Fault plane is on left of photo, with gouge material and yellowish-brown debris. Curved planes in center/right of photo are deformed metamorphic bedding planes related to metamorphic protolith material (e.g. massive sandstone beds). The fault is confirmed by visibly observable discontinuity of planar sub-features on either side of the interpreted fault. This feature trends 210°; dipping 70°. Creating a surface intercept model of this planar geometry observable at this location shows this plane does not intercept the Site at surface or within the proposed drilling depth domain of ~300' bgs (~-150 feet NAVD88). Observed during the Integrated Fracture Trace study.

Appendix A – Data Gap Assessment Photo Log
Former Salvage Yard (D01ME00407), Former Dow Military Airfield
233 Odlin Road, Bangor, Maine

12. Drilling activities underway at SY-BRMW1.

13. Close up of rock core showing foliation and cross cutting quartz veinlets.

14. Clay recovered from SY-BRMW3, approximately 20’ bgs.

15. Metawacke recovered from SY-BRMW3, approximately 38-44’ bgs. Weathered fractures visible.

16. Supplemental surface geophysical clearance underway at SY-BRMW4.

17. Decon of drilling equipment underway.

Appendix A – Data Gap Assessment Photo Log
Former Salvage Yard (D01ME00407), Former Dow Military Airfield
233 Odlin Road, Bangor, Maine

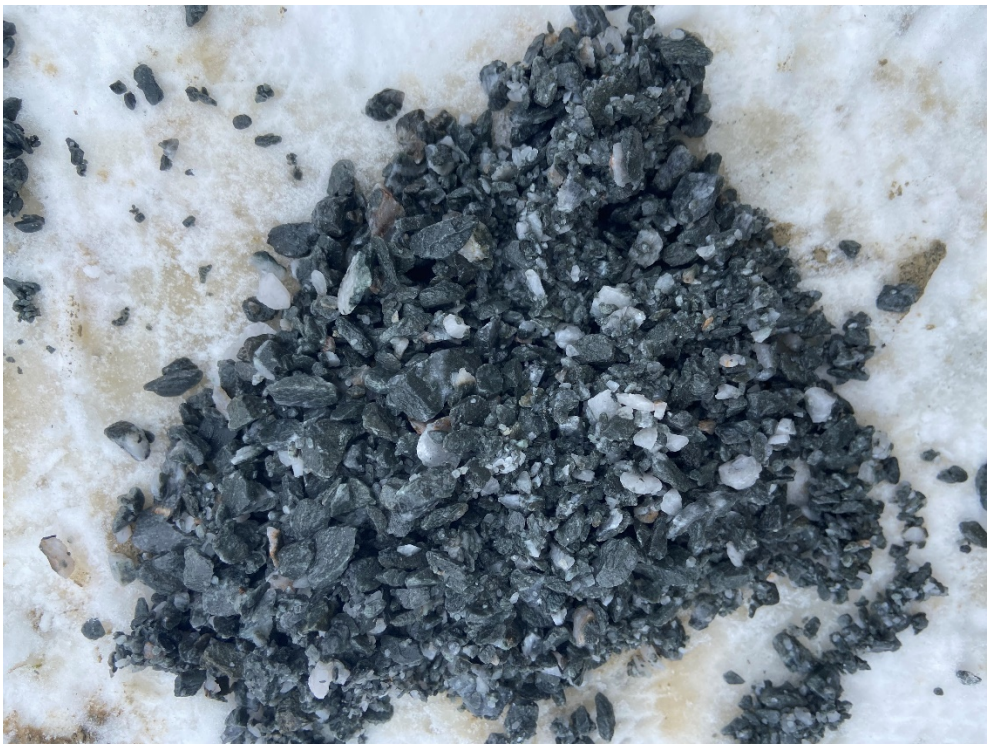
18. Till recovered from SY-BRMW4, 26-31’ bgs.

19. Bedrock recovered from SY-BRMW4, 31-36’ bgs.

Appendix A – Data Gap Assessment Photo Log
Former Salvage Yard (D01ME00407), Former Dow Military Airfield
233 Odlin Road, Bangor, Maine

20. Till recovered from SY-BRMW2, 16-26’ bgs.

21. Bedrock recovered from SY-BRMW2, 31-36’ bgs.



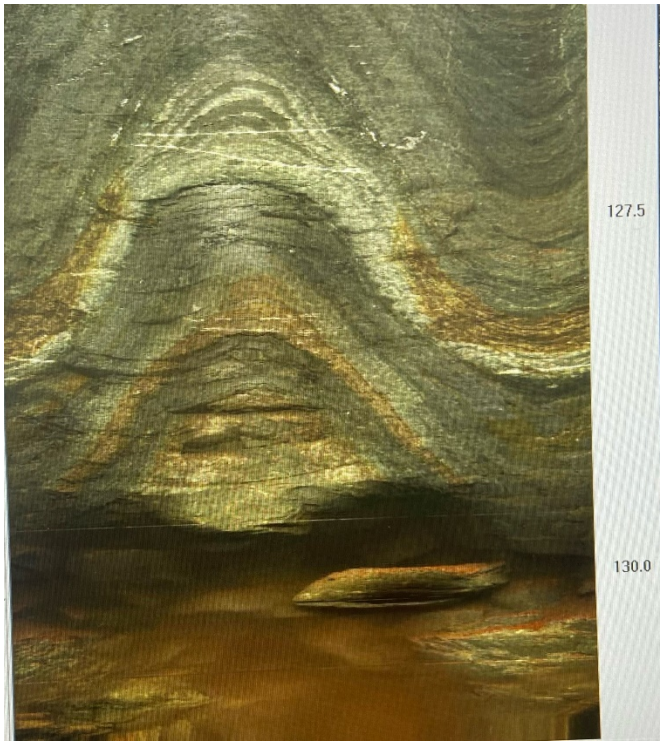
22. Weathered bedding plane fractures in rock recovered from SY-BRMW2, 31-36’ bgs.

23. Layout of rock chips for observation and characterization (120’-300’ bgs) at SY-BRMW2.

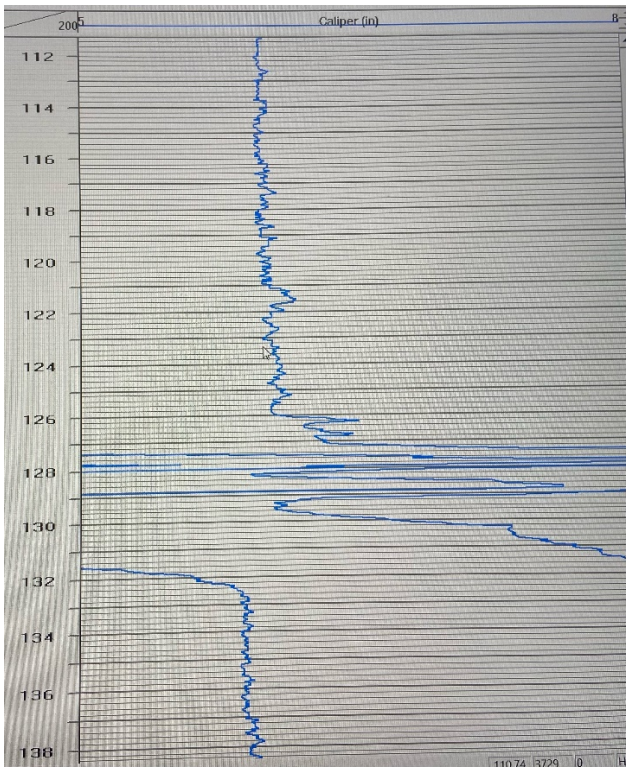
Appendix A – Data Gap Assessment Photo Log
Former Salvage Yard (D01ME00407), Former Dow Military Airfield
233 Odlin Road, Bangor, Maine

24. Example of quartz veinlets observed throughout borehole at SY-BRMW2.

25. Example of large rock fragments with iron oxides on surfaces observed in fracture zones at SY-BRMW2.



26. Return water running visually clear during development of SY-BRMW4.



27. SY-OBMW4R after installation of the protective standpipe and locking cap.

Appendix A – Data Gap Assessment Photo Log
Former Salvage Yard (D01ME00407), Former Dow Military Airfield
233 Odlin Road, Bangor, Maine

28. Screenshot of optical televiewer field data provided by Hager-Richter at the collapsed zone, an apparent fault. Above the fault zone bedding is steep and intact, dipping NW. The void in the middle appears to show fragments of rock lying horizontally which may indicate breccia or drag folded beds below the fault zone.

29. Screenshot of caliper log field data provided by Hager-Richter at the collapsed zone in SY-BRMW5, showing an apparent large void.

30. FLUTe blank liner/FACT strip installation underway at SY-BRMW4.

31. Borehole geophysical logging underway at SY-BRMW1.

32. FLUTe crew installing FACT liner in SY-BRMW5. Shallow groundwater levels required installation of temporary PVC riser section for liner installation.

33. Sectioning/sampling of FACT strip from SY-BRMW4 underway.

34. Setup for blank liner reinstallation/transmissivity profiling underway at SY-BRMW1.

35. Blank liner/FACT removal underway at SY-BRMW2.

36. Installation of FLUTe multilevel well system underway at SY-BRMW2.

37. Permanent FLUTe liner (part of the multilevel well system) laid out and filled with air (via leaf blower) for inspection/attempt to identify leak.

38. One of the separated water line couplings. Visible is the inside of the FLUTe liner when deployed in the borehole. The tear in the clear poly may have occurred as the water line was pulled under tension before separating from the coupling.

39. SY-BRMW1 after completion of installation.

40. Installation of multilevel well system underway at SY-BRMW3.

41. Completed sampling manifold of multilevel well system installed in SY-BRMW3.

SPECIFIC CAPACITY TESTING INFORMATION

Historical Stabilized Flow Rate/Date 400 mL/min / 12-2-2020

Test 1

Start Time 1058
End Time 1128
Flow Rate 480 mL/min (0.127 gpm)
Drawdown 0.64'
Calculated Specific Capacity 0.198

Test 2

Start Time 1205
End Time 1233
Flow Rate 1.25 gpm ((1.15 gpm)
Drawdown 5.35'
Calculated Specific Capacity 0.215

Test 3

Start Time 1247
End Time 1313
Flow Rate 1.10 gpm
Drawdown 5.24'
Calculated Specific Capacity 0.210

Test 4

Start Time 1416
End Time ~~1443~~ 1452
Flow Rate 1.10 gpm
Drawdown ~~4.50'~~ 5.23'
Calculated Specific Capacity ~~0.244~~ 0.210

7-18-22

Notes

T1 - grop pump
T2 - whale pump
T3 - whale pump
T4 - whale pump (interface probe received me)

PROJECT NUMBER: Credere No. 18001468, FUDS No. D01ME000407

LOCATION ID: SY OBMW-5

SPECIFIC CAPACITY TESTING INFORMATION

Historical Stabilized Flow Rate/Date 400 mL/min 8-13-2020, 12-2-2020

Test 1

Start Time 0809
End Time 0829
Flow Rate ~1.33 gpm (averaged)
Drawdown 1.57'
Calculated Specific Capacity 0.847

Test 2

Start Time 0845
End Time 0910
Flow Rate ~1.33 gpm (averaged)
Drawdown 1.90'
Calculated Specific Capacity 0.7

Test 3

Start Time 0930
End Time 0955
Flow Rate ~1.3 gpm
Drawdown 1.58'
Calculated Specific Capacity 0.823

Test 4 - new whale pump

Start Time 1100
End Time 1140
Flow Rate 1.66 gpm
Drawdown 2.42'
Calculated Specific Capacity 0.687

Notes

All tests done w/ whale pump
possibly better stability & recharge from rain last night?
seems clearer/clearer too (less clay/sediment)

- large margin of error estimating flow rate in gpm
- aquifer getting more stressed over time purging?

PROJECT NAME: Former Salvage Yard, Former Dow Military Airfield DATE: 7-19-2022

PROJECT NUMBER: Credere No. 18001468, FUDS No. D01ME000407

LOCATION ID: SY-OBMW-6

SPECIFIC CAPACITY TESTING INFORMATION

Historical Stabilized Flow Rate/Date 400 mL/min / 12-2-2020

Test 1
- Start Time 1208
- End Time 1248
- Flow Rate 1.25 gpm
- Drawdown 6.17'
- Calculated Specific Capacity 0.232

Test 2
- Start Time 1255
- End Time 1320
- Flow Rate 1.18
- Drawdown 5.76'
- Calculated Specific Capacity 0.205

-adjusted flow rate @ 10 min & 15 min

Test 3
- Start Time 1340
- End Time 1405
- Flow Rate 1.11 gpm
- Drawdown 4.54'
- Calculated Specific Capacity 0.214

-adjusted flow rate @ 5 min

Test 4
- Start Time 1522
- End Time 1642
- Flow Rate 1.66 gpm
- Drawdown 8.07'
- Calculated Specific Capacity 0.206

Notes

All tests w/ whale pump
T1 -switched to flow regulator & determined stability @ ~1.25 gpm & DTW = 10.31'
for calculated SpC, used lowest flow rate & @ stabilization (did not average

T4 cont.
11.91 @ 75 min
11.91 @ 80 min

Calculated Specific Capacity 0.04759 gpm/ft

Test 3

Start Time 1445
End Time 1510
Flow Rate 0.05283 gpm
Drawdown 0.22 (11.92-11.70)
Calculated Specific Capacity 0.2401 gpm/ft

Test 4

Start Time 1720
End Time 1740
Flow Rate 0.08453 gpm
Drawdown 0.73 (12.28-11.55
Calculated Specific Capacity 0.1158 gpm/ft

Notes

90% QS1 RECHARGE = DTW 9.9' MPE
TEST 3 HAD SLOW ASYMPTOTIC RECHARGE - DID
NOT MAKE IT TO STATIC WITHIN 0.75HR.
TEST 4 HAD SLOW ASTP RECHARGE; - INCREASE
PURGE RATE TO OVERCOME LINEAR COMPONENT. - DOESN'T MAKE SENSE

DETAILED STABALIZATION CRITERIA

pH: ±0.1 standard units
Temperature: ± 3%
ORP: ±10 mV
DO: ±0.5 mg/L for values less than 2 mg/L or ±10% for values greater than 2 mg/L
Specific conductance: ± 3%
Turbidity: <10 NTU

PURGE DATA

[ ] 0.04 GAL/FT (1" DIAM.)
[x] 0.16 GAL/FT (2" DIAM.)
[ ] 0.65 GAL/FT (4" DIAM.)
[ ] 1.47 GAL/FT (6" DIAM.)

x length of water column = 28.12

Total Well Volume: 4.5

Total Purge Volume: 92

# of well volumes: 20

FINALWATER DEPTH VIA TRANSDUCER (ft): NA

FINAL WATER DEPTH VIA WLM (ft): 12.28

ESTIMATED SEDIMENT THICKNESS IN WELL FOLLOWING DEVELOPMENT: <0.1 (TRACE)

COMMENTS QS1 = 1 GALLON PURGE(1) = 18 GALLONS ; QS2 = 1 GALLON ; PURGE(2) = 35 GALLONS ; QS3 - 1 GALLON ; PURGE 3 = 35 GALLONS. QS4 = 1 gallon. SLOW RECHARGE ON TESTS QS3/4 TO 90% OF ORIGINAL STATIC (9.9') WAS SLOW GOING ICM SUGGESTS PERFORMING QS5 (FINAL) AT A LATER DATE TO CHARACTERIZE WELL MORE COMPLETELY; OVERALL SIGNIFICANT INCREASE IN GW QUALITY (↓NTUs) THROUGH DEVELOPMENT

MONITORING WELL DEVELOPMENT LOG

Credere Associates. LLC. 776 Main Street. Westbrook. ME 04092

PROJECT NAME: Former Salvage Yard, Former Dow Military Airfield DATE: 06/22/2022

PROJECT NUMBER: Credere No. 18001468, FUDS No. D01ME000407

LOCATION ID: SY-OBMW13

SPECIFIC CAPACITY TESTING INFORMATION

Historical Stabilized Flow Rate/Date 400 ml/min / 08/11/2020

Test 1
- Start Time 13:45
- End Time 14:05
- Flow Rate 0.0898 gpm
- Drawdown 0.48' (10.74 - 10.26)
- Calculated Specific Capacity 0.1871 gpm/ft

Test 2
- Start Time 1500
- End Time 1520
- Flow Rate ~~0.9~~ 0.0977 gpm
- Drawdown 0.52' (10.82 - 10.3)
- Calculated Specific Capacity 0.1878 gpm/ft

Test 3
- Start Time 1625
- End Time 1640
- Flow Rate 0.0951 gpm
- Drawdown 0.68 (10.98 - 10.3)
- Calculated Specific Capacity 0.1398 gpm/ft

Test 4
- Start Time 0913 (6/23)
- End Time 0930
- Flow Rate 0.0898 gpm
- Drawdown 0.25 (10.49 - 10.24)
- Calculated Specific Capacity 0.3741 gpm/ft

Notes

90% RECHARGE OF QS1 = DTW 10.3'
TEST #3 WAS LOWER QS THAN #1&2?
TEST 4 SHOWS SIGNIFICANT CAPACITY

DETAILED STABALIZATION CRITERIA

pH: ±0.1 standard units

SY-BRMW1

CLIENT United States Army Corps of Engineers
PROJECT NAME Former Salvage Yard, Former Dow Military Airfield
PROJECT # 18001468
PROJECT LOCATION 233 Odlin Road, Bangor, Maine
DATE STARTED 12/2/22 **LOGGED BY** SG, PT, ID
DEPTH TO WATER 13.10 ft.* **WELL DIAMETER** 6 in.
CONTRACTOR Cascade Drilling, LP/Arlen Little, Al Sizemore
WELL MATERIALS Steel Flush Thread; FLUTe Liner
DRILLING METHOD Sonic (overburden)/air hammer (bedrock)
ANNULUS MATERIALS NA, NA
DRILLING EQUIPMENT Terra Sonic 150C Crawler, borehole diam. 6 in.
MP ELEVATION 161.67 **GROUND ELEVATION** 158.52
NOTES SG - Sean Gannon; PT - Peter Thompson; ID - Ian Desjarlais. * - feet below top of casing, water level measurements taken on 2/6/23.

Depth (ft)	Penetration/ Recovery (in)	Blow Counts	Field Screening (ppm)	Lab Analytical Sample	Graphic Log	LITHOLOGY
0	60/27		1.1 - 1.3			0-27" Dark brown, moist, poorly sorted, SILT and fine to coarse SAND, little fine Gravel (angular to rounded), trace coarse Gravel (angular to rounded). 0-5 feet drilled in approximately 2 minutes.
5	24/20		0.0 - 0.0			0-20" GRANITE COBBLE in dark brown, moist, Silt and fine Sand matrix, some granite and metawacke rock fragments (angular). 5-7 feet drilled in approximately 2.25 minutes.
	36/36		0.1 - 0.1			0-12" Dark olive brown, moist, poorly sorted, SILT and fine to coarse SAND matrix, some granite cobbles. 7-10 feet drilled in approximately 3 minutes.
10	84/82		0.2 - 0.2			12-36" Brown to light gray, moist, CLAY, mottled, cohesive (Presumpscot Formation) 0-82" Brown to olive gray, moist, CLAY, mottled, cohesive, stiff. 10-17 feet drilled in approximately 2 minutes.
15						
	120/113		0.3 - 0.3			0-79" Gray, moist, SILT and CLAY, no mottling, soft, very plastic. 17-27 feet drilled in approximately 5 minutes.
20						
						79-120" Dark olive gray, moist, TILL (poorly sorted SILT and fine to coarse SAND, little to some well rounded Gravel)
25	120/120		0.3 - 0.3			0-24" Dark gray, moist, TILL (poorly sorted SILT and fine to coarse SAND, little to some gravel, trace cobbles). 27-37 feet drilled in approximately 5 minutes.
						24-42" METAWACKE (boulder)
30						42-74" Dark gray, moist, TILL (poorly sorted Silt and fine to coarse Sand, trace Clay, little to some subangular cobbles and subrounded gravel), coarser than above
						74-84" METAWACKE (boulder)
						84-96" Dark gray, moist, TILL (Silt and fine to coarse Sand and Silt, some Cobbles)
35						96-120" METAWACKE (weathered bedrock). Top of bedrock at 35 ft. Foliation perpendicular to core, indicating likely boulders above competent bedrock.
	60/38		0.0 - 0.3			0-38" Gray-green, fine grained METAWACKE, trace calcite veinlets, moderately competent, not chemically weathered, appears dry. Oxidized bedding plane fracture at 39 feet with foliation approximately 60 degrees

WELL DIAGRAM
Casing Top Elev: 161.67 (ft)
Casing Type: Stick Up (3.15')

- Steel Casing (4")
- Portland Cement/Bentonite Grout Mixture Around Steel Casing
- 35' Depth to competent bedrock
- 5' Casing into competent bedrock

BEDROCK FLUTE WELL CONSTRUCTION DETAILS

SITE INFORMATION	DRILLING EQUIPMENT
Project Number/Client: 18001468/USACE	**Equipment (make/model):** Terrasonic 150C
Site Location: Dow Salvage Yard, Bangor, ME	**Casing/Auger/Core Diameter:** 6"/ 4"
Date Start - Finish: 12/2/2022 - 1/29/2023	**Drill Casing Material:** Steel
Credere Representative: S. Gannon	**CONTRACTOR**
Well Type Bedrock Open Hole with FLUTe System	**Drilling Contractor/Foreman:** Cascade/Al Sizemore

Top of well elevation (PVC FLUTe coupling; ft NAVD88): 161.67
Stickup height (in): 3.15
Ground elevation (ft NAVD88): 158.52

Port 1 connection elevation (ft NAVD88): 161.89
Port 2 connection elevation (ft NAVD88): 161.87
Port 3 connection elevation (ft NAVD88): 161.87
Top of tag line elevation (ft NAVD88): 161.77

Overburden thickness (ft): 35
Casing type: steel
Casing diameter (in): 6
Borehole diameter in overburden (in): 8

Generalized description of overburden: Brown silt and sand with little gravel and cobbles, transitioning to gray clay at approx. 8' bgs and to gray till at approx. 24' bgs

Grout material: Portland cement/bentonite gel grout
Weathered bedrock thickness (ft): 2
Depth to competent bedrock (ft bgs): 37
Depth of casing into competent bedrock (ft): 5
Bottom of permanent casing (ft bgs): 42

Generalized description of rock type (fracture depths, etc.): Fine grained gray metawacke with quartz veins; faults present at approx. 153' and 181' bgs. Other possible transmissive fractures present at approx. 43' and 71-73' bgs.

Depth to water (ft bgs): 13.10
Borehole diameter in bedrock (in): 6
Port 1 depth interval (ft bgs): 42-52
Port 2 depth interval (ft bgs): 65-75
Port 3 depth interval (ft bgs): 150-157
Depth of borehole (ft bgs): 300

Not to scale

Hydraulically Active Fractures Present? (Based on Heat Pulse Flow Meter Response)	
Port 1	Yes - Flow Into and Up Under Pumping Conditions
42-52 feet bgs	
Port 2	Possible Flow Under Pumping Conditions, Flow In/Out Unknown
65-75 feet bgs	
Port 3	Yes - Flow Into and Up Under Pumping Conditions
150-157 feet bgs	

Remarks and Well Details

bgs - below ground surface

NAVD88 - North American Vertical Datum of 1988

- Developed by surging with air hammer

- Locking cap and padlock installed

- Elevations recorded by Psilga & Day Land Surveyors, January 4 & 24, 2024. Elevations reference the North American Vertical Datum of 1988 (NAVD88) using GPS tied to the NGS CORS Network (via Maine Department of Transportation VRS GPS control network). Elevations computed from GEOID 18 based on two permanent benchmarks installed and observed in November 2020, upon which an OPUS solution was obtained and three wire levels were run.

DATE STARTED 1/20/23 **LOGGED BY** SG, LK, PT
DEPTH TO WATER 6.83 ft.* **WELL DIAMETER** 6 in.
CONTRACTOR Cascade Drilling, LP/Al Sizemore
WELL MATERIALS Steel Flush Thread; FLUTe Liner
DRILLING METHOD Sonic (overburden)/air hammer (bedrock)
ANNULUS MATERIALS NA, NA
DRILLING EQUIPMENT Terra Sonic 150C Crawler, borehole diam. 6 in.
MP ELEVATION 166.06 **GROUND ELEVATION** 163.14
NOTES SG - Sean Gannon; LK - Lauren Kaija; PT - Peter Thompson. * - feet below top of casing, water level measurements taken on 2/6/23.

Depth (ft)	Penetration/ Recovery (in)	Blow Counts	Field Screening (ppm)	Lab Analytical Sample	Graphic Log	LITHOLOGY
0	72/84		0.1 - 0.1			0-12" Dark brown, moist, SILT and fine SAND, trace fine Gravel, mottled. 0-6 feet drilled in approximately 1 minute. 12-84" Light brown, moist, SILT and fine SAND, trace fine Gravel, mottled (recovery exceeds penetration due to in situ density of material and mechanical breaks upon retrieval)
5	120/132		0.7 - 0.7			0-49" Same as above. 6-16 feet drilled in approximately 5 minutes.
10						49-132" Grayish brown, moist, TILL (SILT and CLAY, some subrounded to subangular fine to coarse Sand, little subrounded to subangular fine to coarse Gravel), poorly sorted, much more dense than above, much less to no mottling, especially deeper
15	120/132		0.1 - 0.1			0-123" Same as above, except transitioning to more greenish-gray, especially after 24". 16-26 feet drilled in approximately 25 minutes.
20						
25	60/50		0.0 - 0.0			123-132" Light gray METAWACKE, weathered, with iron oxide. 0-50" Light gray METAWACKE with trace quartz veins (less than 1 centimeter), no massive quartz, weathered, substantial iron oxide on weathered fractures and unconsolidated rock. Multiple bedding plane fractures approximately 60 degrees to core. 26-31 feet drilled in approximately 5 minutes.
30	60/60		0.0 - 0.0			0-60" Same as above, except with trace larger (approximately 1 centimeter to 1 inch) quartz veins, substantial iron oxide on fractures. Weathered bedding plane fractures approximately 60 degrees to core. Lower rock competency first approximately 1 foot consistent with bottom of last core, higher rock competency rest of core. RQD = 55"/60" = 92% = excellent. 31-36 feet drilled in approximately 10 minutes.
35			0.0 - 0.0			Light gray, dry, METAWACKE, little Quartz, approximately 10% iron oxide. Smooth and consistent drilling, no rig chatter. 36-40 feet drilled in approximately 4 minutes. No water return.

CREDERE ENV 2015 - GINT STD US LAB.GDT - 3/28/24 14:02 - P:\18001468 USACE DOW SALVAGE YARD\WORK\FIELD DOCUMENTATION\GINT\DOW_BEDROCK BORING LOGS_REV 07-2023.GPJ

Depth (ft)	Penetration/ Recovery (in)	Blow Counts	Field Screening (ppm)	Lab Analytical Sample	Graphic Log	LITHOLOGY	WELL DIAGRAM
80			0.0 - 0.0			Light gray METAWACKE (bigger cuttings), red oxidiation and weathering. 80-85 feet drilled in approximately 5 minutes. Estimated water return approximatly 1/4-1/2 gallon per minute (no drilling water added, water from formation). Driller noted soft rock between 84-86 feet.	
85			0.0 - 0.0			Light gray METAWACKE, increased red oxidiation and weathering. 85-90 feet drilled in approximately 5 minutes. Estimated water return approximatly 2-3 gallons per minute.	Port 2 depth interval 80.5-95.5' bgs
90			0.0 - 0.0			Light gray METAWACKE, approximately 3-5% iron oxide. 90-95 feet drilled in approximately 10 minutes, except 94-95 feet drilled in approximately 1-1.5 minutes. Estimated water return approximately 5 gallons per minute, increasing to up to approximately 10 gallons per minute around 94-95 feet, possibly indicating fracture.	
95			0.0 - 0.0			Same as above. 95-100 feet drilled in approximately 7 minutes. Estimated water return approximately 5-10 gallons per minute.	
100			0.0 - 0.0			Gray METAWACKE, fine cuttings, little to no iron oxide, some quartz. 100-105 feet drilled in approximately 6 minutes. Estimated water return approximately 5-10 gallons per minute, some bursts noted.	
105			0.0 - 0.0			Gray METAWACKE, fine cuttings, some quartz, trace iron oxide. 105-110 feet drilled in approximately 7 minutes. Estimated water return approximately 10 gallons per minute.	
110			0.0 - 0.0			Gray METAWACKE, fine cuttings, some quartz, less iron oxide than above. 110-115 feet drilled in approximately 7 minutes. Estimated water return approximately 10 gallons per minute.	
115			0.0 - 0.0			Same as above. Consistent drill rate, very little to no rig chatter noted. 115-120 feet drilled in approximately 7 minutes. Estimated water return approximately 5-10 gallons per minute.

Depth (ft)	Penetration/ Recovery (in)	Blow Counts	Field Screening (ppm)	Lab Analytical Sample	Graphic Log	LITHOLOGY	WELL DIAGRAM
120			0.0 - 0.0			Same as above. Possible small fracture at 121-122 feet. Return water becoming clearer, more iron oxide (approximately 10-15%), larger cuttings. 120-125 feet drilled in approximately 7 minutes. Estimated water return approximately 10 gallons per minute.	
125			0.0 - 0.0			Gray METAWACKE, similar sized cuttings as above. Little to no iron oxide, more quartz. 125-130 feet drilled in approximately 7 minutes. Estimated water return approximately 5-10 gallons per minute.	
130			0.0 - 0.0			Same as above, slight change in composition, very little to no iron oxide, replaced by quartz. 130-135 feet drilled in approximately 6 minutes. Estimated water return approximately 5-10 gallons per minute.	
135			0.0 - 0.0			Similar to above, light gray METAWACKE with minor quartz veinlets, trace to no iron oxide. Consistent drill rate, driller noted soft rock at 138-140 feet. 135-140 feet drilled in approximately 8 minutes. Estimated water return approximately 5-8 gallons per minute.	
140			0.0 - 0.0			Dark gray METAWACKE, trace iron oxide, increasing to 10-15% iron oxide at 147-148 feet, trace quartz. 140-150 feet drilled in approximately 13-14 minutes. Estimated water return approximately 5-10 gallons per minute. Slight increase in water return at approximately 147-148 feet, estimated water return approximately 10 gallons per minute. No change in return water color.	
145			0.0 - 0.0				
150			0.0 - 0.0			Dark gray METAWACKE, with some larger cuttings with iron oxide, trace quartz. Smooth drill rate noted. Return water more clear than above. No noticeable change in water return. 150-160 feet drilled in approximately 12-13 minutes. Estimated water return approximately 5-10 gallons per minute.	
155			0.0 - 0.0

160			0.0 - 0.0			Dark gray METAWACKE, approximately 5-8% quartz veinlets, very little to no iron oxide, possible graphite or manganese oxides in return water, return water is dark. Smooth drill rate noted. 160-170 feet drilled in approximately 9 minutes. Estimated water return approximately 8-10 gallons per minute.	
165			0.0 - 0.0				
170			0.0 - 0.0			Gray METAWACKE, significant amounts of quartz, little to no iron oxide, no major changes in drill rate noted. 170-175 feet drilled in approximately 5 minutes. Estimated water return approximately 8-10 gallons per minute.	Open hole bedrock with blank liner
175			0.0 - 0.0			Same as above, no major changes in iron oxide noted to indicate fractures. Substantial quartz veinlets. 175-180 feet drilled in approximately 5 minutes. Estimated water return approximately 8-10 gallons per minute.	
180			0.0 - 0.0			No major change from above, approximately 50% quartz, no iron oxide. Water increasing clarity down to 190 feet. 180-190 feet drilled in approximately 12-13 minutes. Estimated water return approximately 10 gallons per minute.	
185			0.0 - 0.0				
190			0.0 - 0.0			Dark gray to black METAWACKE, approximately 20-30% quartz. Weathered cuttings (with iron oxide) becoming notably larger around 195 feet, with less quartz (approximately 20%). 190-200 feet drilled in approximately 12-13 minutes. Estimated water return approximately 10 gallons per minute.	
195			0.0 - 0.0

Depth (ft)	Penetration/ Recovery (in)	Blow Counts	Field Screening (ppm)	Lab Analytical Sample	Graphic Log	LITHOLOGY	WELL DIAGRAM
200			0.0 - 0.0			Same as above. Iron oxide cuttings presumed to be falling down from above in borehole, less quartz, mostly clean gray to black Metawacke. Slight soft spot noted at approximately 204-205 feet. No major change in water return or drill rate noted. 200-210 feet drilled in approximately 12-14 minutes. Estimated water return approximately 10 gallons per minute.	
205			0.0 - 0.0				
210			0.0 - 0.0			Dark gray METAWACKE, trace Quartz. 210-220 feet drilled in approximately 11 minutes. Estimated water return approximately 10 gallons per minute.	
215			0.0 - 0.0				
220			0.0 - 0.0			Same as above. 220-230 feet drilled in approximately 13 minutes. Estimated water return approximately 10 gallons per minute.	
225			0.0 - 0.0				
230			0.0 - 0.0			Same as above, with iron oxide cuttings apparently falling in from above in borehole, and increasing quartz with depth, up to approximately 10-20% at most. 230-240 feet drilled in approximately 14 minutes. Estimated water return approximately 10 gallons per minute.	
235			0.0 - 0.0

Depth (ft)	Penetration/ Recovery (in)	Blow Counts	Field Screening (ppm)	Lab Analytical Sample	Graphic Log	LITHOLOGY	WELL DIAGRAM
240			0.0 - 0.0			Same as above, with less quartz (approximately 5-10%), trace iron oxide. 240-245 feet drilled in approximately 7 minutes. Estimated water return approximately 10-12 gallons per minute.	
245			0.0 - 0.0			Gray METAWACKE, trace weathered bedrock, trace quartz. Possible small fracture noted between 246-250 feet. Slight increase in water return and drill rate. 245-250 feet drilled in approximately 7 minutes. Estimated water return approximately 10-15 gallons per minute.	
250			0.0 - 0.0			Similar to above, with some iron oxide, quartz, and weathered bedrock. Wider variety of colors noted. Possible continuation of above fracture from 250-253 feet. 250-255 feet drilled in approximately 5-6 minutes. Estimated water return approximately 10-15 gallons per minute.	
255			0.0 - 0.0			Similar to above, with more iron oxide, more quartz, more weathered bedrock, likely still soft rock. 255-260 feet drilled in approximately 5-6 minutes. Estimated water return approximately 10-15 gallons per minute.	Port 3 depth interval 252.5-262.5' bgs
260			0.0 - 0.0			Similar to above, rock seems soft, large zone of quartz encountered, approximately 25% large iron oxide and other large cuttings appear to be falling in from higher in borehole. 260-265 feet drilled in approximately 4-5 minutes. Estimated water return approximately 15 gallons per minute.	
265			0.0 - 0.0			Weathered rock, increasing to approximately 60% quartz, less but still substantial iron oxide, return water clearing up. 265-270 feet drilled in approximately 4-5 minutes. Estimated water return approximately 15 gallons per minute.	
270			0.0 - 0.0			Dark gray METAWACKE, trace quartz, trace iron oxide. No major changes in drill rate or water return noted. 270-280 feet drilled in approximately 10-12 minutes. Estimated water return approximately 10-15 gallons per minute.	
275			0.0 - 0.0				Open hole bedrock with blank liner

SITE INFORMATION	DRILLING EQUIPMENT
Project Number/Client: 18001468/USACE	**Equipment (make/model):** Terrasonic 150C
Site Location: Dow Salvage Yard, Bangor, ME	**Casing/Auger/Core Diameter:** 6"/ 4"
Date Start - Finish: 1/20/2023 - 1/24/2023	**Drill Casing Material:** Steel
Credere Representative: S. Gannon	**CONTRACTOR**
Well Type Bedrock Open Hole with FLUTe System	**Drilling Contractor/Foreman:** Cascade/Al Sizemore

BEDROCK FLUTE WELL CONSTRUCTION DETAILS

Top of well elevation (PVC FLUTe coupling; ft NAVD88): 166.01
Stickup height (in): 2.87
Ground elevation (ft NAVD88): 163.14

Port 1 connection elevation (ft NAVD88): 166.27
Port 2 connection elevation (ft NAVD88): 166.29
Port 3 connection elevation (ft NAVD88): 166.31
Top of tag line elevation (ft NAVD88): 166.34

Overburden thickness (ft): 26
Casing type: steel
Casing diameter (in): 6
Borehole diameter in overburden (in): 8

Generalized description of overburden: Brown silt and sand, transitioning to gray till at approx. 10' bgs.

Grout material: Portland cement/bentonite gel grout
Weathered bedrock thickness (ft): 1
Depth to competent bedrock (ft bgs): 26
Depth of casing into competent bedrock (ft): 10
Bottom of permanent casing (ft bgs): 36

Depth to water (ft bgs): 6.83

Generalized description of rock type (fracture depths, etc.): Fine grained gray metawacke with quartz veins; fault present at approx. 85-95' bgs. Other possible transmissive fractures present at approx. 64-69' and 258-261' bgs.

Borehole diameter in bedrock (in): 6

Port 1 depth interval (ft bgs): 60.5-70.5
Port 2 depth interval (ft bgs): 80.5-95.5
Port 3 depth interval (ft bgs): 252.5-262.5

Depth of borehole (ft bgs): 295

Not to scale

Hydraulically Active Fractures Present? (Based on Heat Pulse Flow Meter Response)	
Port 1 60.5-70.5 feet bgs	Possible Flow Under Pumping Conditions, Flow In/Out Unknown
Port 2 80.5-95.5 feet bgs	Yes - Flow Into and Down Under Ambient Conditions; Flow Into & Up and Into & Down Under Pumping Conditions
Port 3 252.5-262.5 feet bgs	Yes - Flow Out Under Ambient and Pumping Conditions

Remarks and Well Details

bgs - below ground surface

NAVD88 - North American Vertical Datum of 1988

- Developed by surging with air hammer

- Locking cap and padlock installed

- Elevations recorded by Psilga & Day Land Surveyors, January 4 & 24, 2024. Elevations reference the North American Vertical Datum of 1988 (NAVD88) using GPS tied to the NGS CORS Network (via Maine Department of Transportation VRS GPS control network). Elevations computed from GEOID 18 based on two permanent benchmarks installed and observed in November 2020, upon which an OPUS solution was obtained and three wire levels were run.

Depth (ft)	Penetration/ Recovery (in)	Blow Counts	Field Screening (ppm)	Lab Analytical Sample	Graphic Log	LITHOLOGY
0	72/72		0.10 - 0.10			0-20" Medium brown, moist, poorly sorted, SILT and fine to coarse SAND, little fine gravel, trace concrete, little coarse gravel. 0-6 feet drilled in approximately 1 minute.
						20-34" Dark brown, moist, SILT and CLAY, mottled
						34-72" Light brown, moist, SILT and CLAY, mottled
5	120/120		0.06 - 0.06			0-12" Medium brown, moist, fine to coarse SAND, some fine Gravel, little coarse Gravel. 6-16 feet drilled in approximately 2 minutes.
						12-120" Light brown, moist, SILT and CLAY, some gray Clay, transitioning to higher proportion of Clay especially after 66", all gray Clay last 6".
10						
15	120/120		0.04 - 0.04			0-114" Light gray, wet, CLAY (expanding). 16-26 feet drilled in approximately 2 minutes.
20						
25	96/92		0.01 - 0.01			114-120" Light gray, wet, loose TILL (fine to coarse SAND, angular fine Gravel, trace coarse Gravel)
						0-30" Light gray, moist, TILL (SILT, some Clay, some fine to coarse Sand, little angular fine to coarse gravel). 26-34 feet drilled in approximately 10 minutes.
30						30-68" Light gray, dry, fractured rock/rock flour (BOULDER), little angular fine to coarse Gravel
						68-92" Light gray, moist, TILL (SILT, some Clay, some fine to coarse Sand, little angular fine to coarse gravel). Driller reports consistent drilling conditions between 27-38 feet.
	24/24		0.01 - 0.01			0-24" Same as above. 34-36 feet drilled in approximately 10 minutes.
35	24/60		0.01 - 0.01			0-30" Poorly sorted, coarse SAND and fine to coarse GRAVEL (gray metawacke, sandstone, diorite; Sand is subround to subangular, Gravel is more angular). 36-38 feet drilled in approximately 15 minutes.
	72/42		0.01 - 0.01			30-60" Weathered BEDROCK (gray metawacke with quartz/calcite veins and massive quartz/calcite). Several pieces 1-3". RQD=0%.

SITE INFORMATION

Project Number/Client: 18001468/USACE

Site Location: Dow Salvage Yard, Bangor, ME

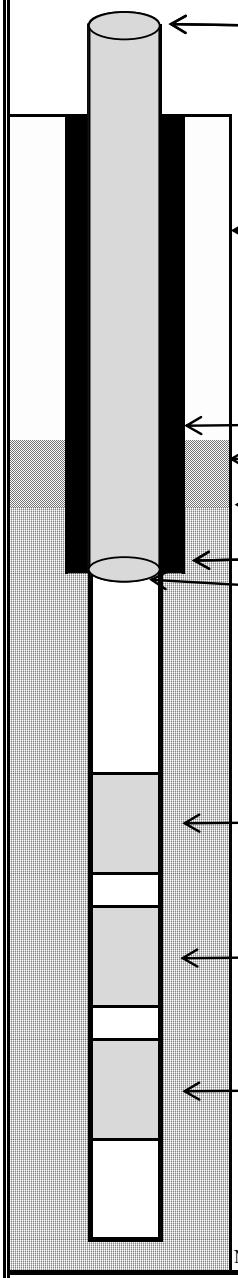
Date Start - Finish: 12/14/2022 - 1/27/2023

Credere Representative: S. Gannon

Well Type: Bedrock Open Hole with FLUTe System

DRILLING EQUIPMENT

Equipment (make/model): Terrasonic 150C



Casing/Auger/Core Diameter: 6"/ 4"

Drill Casing Material: Steel

CONTRACTOR

Drilling Contractor/Foreman: Cascade/Al Sizemore

BEDROCK FLUTE WELL CONSTRUCTION DETAILS

Top of well elevation (PVC FLUTe coupling; ft NAVD88): 156.32

Stickup height (in): 2.69

Ground elevation (ft NAVD88): 153.63

Overburden thickness (ft): 37

Casing type: steel

Casing diameter (in): 6

Borehole diameter in overburden (in): 8

Grout material: Portland cement/bentonite gel grout

Weathered bedrock thickness (ft): 1

Depth to competent bedrock (ft bgs): 38

Depth of casing into competent bedrock (ft): 9

Bottom of permanent casing (ft bgs): 47

Depth to water (ft bgs): 10.70

Borehole diameter in bedrock (in): 6

Port 1 depth interval (ft bgs): 47-62

Port 2 depth interval (ft bgs): 145-155

Port 3 depth interval (ft bgs): 287-297

Depth of borehole (ft bgs): 302

Not to scale

Port 1 connection elevation (ft NAVD88): 156.59

Port 2 connection elevation (ft NAVD88): 156.58

Port 3 connection elevation (ft NAVD88): 156.61

Top of tag line elevation (ft NAVD88): 156.64

Generalized description of overburden: Brown silt and clay, transitioning to wet/expanding gray clay at approx. 16' bgs and to gray till at approx. 26' bgs

Generalized description of rock type (fracture depths, etc.): Fine grained gray metawacke with quartz veins; fault present at approx. 149-152' bgs. Other possible transmissive fractures present at approx. 73', 101', 252', and 291' bgs.

Hydraulically Active Fractures Present? (Based on Heat Pulse Flow Meter Response)	
Port 1 47-62 feet bgs	Possible Flow Under Pumping Conditions, Flow In/Out Unknown
Port 2 145-155 feet bgs	Yes - Flow Into and Down Under Ambient Conditions; Flow Into and Up Under Pumping Conditions
Port 3 287-297 feet bgs	Yes - Flow Out Under Ambient Conditions; Flow Into and Up Under Pumping Conditions

Remarks and Well Details

bgs - below ground surface

NAVD88 - North American Vertical Datum of 1988

- Developed by surging with air hammer

- Locking cap and padlock installed

- Elevations recorded by Psilga & Day Land Surveyors, January 4 & 24, 2024. Elevations reference the North American Vertical Datum of 1988 (NAVD88) using GPS tied to the NGS CORS Network (via Maine Department of Transportation VRS GPS control network). Elevations computed from GEOID 18 based on two permanent benchmarks installed and observed in November 2020, upon which an OPUS solution was obtained and three wire levels were run.

PROJECT LOCATION 233 Odlin Road, Bangor, Maine

Depth (ft)	Penetration/ Recovery (in)	Blow Counts	Field Screening (ppm)	Lab Analytical Sample	Graphic Log	LITHOLOGY	WELL DIAGRAM
40			0.0 - 0.0			Same as above. 40-50 feet drilled in approximately 11 minutes. Estimated water return approximately 1 gallon per minute. Same as above, except little quartz, trace iron oxide, larger grain size. Rig chatter noted.	
45			0.0 - 0.0			Same as above, possible soft zone at approximately 46 to 49 feet (faster advance rate, smaller cuttings)	
50			0.0 - 0.0			Same as above, except some iron oxide, trace quartz. 50-60 feet drilled in approximately 7 minutes. Estimated water return approximately 1 gallon per minute. Rig chatter noted	Open hole bedrock with blank liner
55			0.0 - 0.0			Same as above. Cuttings observed to be coarse gravel-sized. Water return increasing to an estimated 5 to 10 gallons per minute and very turbid. Soft bedrock conditions noted.	
60			0.0 - 0.0			Dark gray METAWACKE, some quartz, some iron oxide. 60-70 feet drilled in approximately 10 minutes. Estimated water return approximately 5 to 10 gallons per minute.	Port 2 depth interval 56-66' bgs
65			0.1 - 0.1			Dark gray METAWACKE, some quartz, less than approximately 5% iron oxide, some fine gravel. Cuttings inconsistent with rest of run (maybe falling from above). Water return rate increasing and water running turbid.	
70			0.1 - 0.1			Same as above, except quartz throughout, some iron oxide. Cuttings observed to be larger, coarse gravel-sized. Return water running more clear. 70-80 feet drilled in approximately 10 minutes. Estimated water return approximately 10 to 15 gallons per minute. Rig chatter noted	
75			0.1 - 0.1			Same as above, except trace to no iron oxide. Cuttings observed to be smaller, fine-gravel sized.

80			0.1 - 0.1			Dark gray METAWACKE and QUARTZ (approximately 50%), no iron oxide. 80-90 feet drilled in approximately 8 minutes. Estimated water return approximately 15 gallons per minute and running gray.	
85			0.1 - 0.1			Dark gray METAWACKE, trace quartz. Rig chatter noted.	
						Same as above, except no quartz. Very soft bedrock conditions noted.	
90			0.1 - 0.1			Dark gray METAWACKE, approximately 15-20% iron oxide lessening down to 95 feet, no quartz observed. Soft bedrock conditions and quick drill rate noted. 90-100 feet drilled in approximately 5 minutes. Estimated water return approximately 10 to 15 gallons per minute.	
95			0.1 - 0.1			Dark gray METAWACKE, approximately 25% quartz, trace iron oxide	← Open hole bedrock with blank liner
100			0.1 - 0.1			Dark gray METAWACKE, little quartz, trace iron oxide. 100-110 feet drilled in approximately 6 minutes. Estimated water return approximately 15 gallons per minute and running relatively clear.	
						Same as above, except increasing to approximately 25% quartz	
105			0.1 - 0.1			Same as above, except decreasing to trace quartz	
						Same as above, except increasing to approximately 50% quartz. Rig chatter noted.	
110			0.1 - 0.1			Dark gray METAWACKE, approximately 10% quartz, trace iron oxide. 110-120 feet drilled in approximately 8 minutes, drill rate noted to be steady and fast. Estimated water return approximately 15 gallons per minute and running relatively clear.	
115			0.1 - 0.1

Depth (ft)	Penetration/ Recovery (in)	Blow Counts	Field Screening (ppm)	Lab Analytical Sample	Graphic Log	LITHOLOGY	WELL DIAGRAM
120			0.1 - 0.1			Dark gray METAWACKE and IRON OXIDE (approximately 50%). Driller reports large fracture at approximately 124 feet. 120-130 feet drilled in approximately 6 minutes. Estimated water return approximately 15 to 20 gallons per minute.	
125			0.1 - 0.1			Same as above. Large increase in rate of water return noted, driller observed to raise and lower rods to purge fracture. Water returning clear below fracture.	Port 3 depth interval 123-133' bgs
						Dark gray METAWACKE, trace quartz, trace iron oxide	
130			0.1 - 0.1			Dark gray METAWACKE, little quartz, trace iron oxide. 130-140 feet drilled in approximately 10 minutes. Return to consistent drilling rate noted. Estimated water return approximately 30 gallons per minute.	
135			0.1 - 0.1				
140			0.1 - 0.1			Same as above. 140-150 feet drilled in approximately 8 minutes. Estimated water return approximately 30 gallons per minute and running clear.	
145			0.1 - 0.1				
150			0.1 - 0.1			Dark gray METAWACKE, approximately 10 to 20% quartz, no iron oxide. 150-160 feet drilled in approximately 13 minutes and noted to be slower possibly due to solid bedrock with few to no fractures. Estimated water return approximately 30 gallons per minute.	
155			0.1 - 0.1

BEDROCK FLUTE WELL CONSTRUCTION DETAILS

SITE INFORMATION	DRILLING EQUIPMENT
Project Number/Client: 18001468/USACE	**Equipment (make/model):** Terrasonic 150C
Site Location: Dow Salvage Yard, Bangor, ME	**Casing/Auger/Core Diameter:** 6"/ 4"
Date Start - Finish: 12/7/2022 - 1/26/2023	**Drill Casing Material:** Steel
Credere Representative: S. Gannon	**CONTRACTOR**
Well Type Bedrock Open Hole with FLUTe System	**Drilling Contractor/Foreman:** Cascade/Al Sizemore

Top of well elevation (PVC FLUTe coupling; ft NAVD88): 151.44

Stickup height (in): 2.79

Ground elevation (ft NAVD88): 148.65

Overburden thickness (ft): 25

Casing type: steel

Casing diameter (in): 6

Borehole diameter in overburden (in): 8

Grout material: Portland cement/bentonite gel grout

Weathered bedrock thickness (ft): 1

Depth to competent bedrock (ft bgs): 26

Depth of casing into competent bedrock (ft): 3

Bottom of permanent casing (ft bgs): 29

Depth to water (ft bgs): 4.70

Borehole diameter in bedrock (in): 6

Port 1 depth interval (ft bgs): 29-44

Port 2 depth interval (ft bgs): 56-66

Port 3 depth interval (ft bgs): 123-133

Depth of borehole (ft bgs): 301.5

Not to scale

Port 1 connection elevation (ft NAVD88): 151.74

Port 2 connection elevation (ft NAVD88): 151.62

Port 3 connection elevation (ft NAVD88): 151.74

Top of tag line elevation (ft NAVD88): 151.77

Generalized description of overburden: Brown silt and sand, transitioning to brown silt and clay at approx. 7' bgs, to gray clay at approx. 13' bgs, and to gray till approx. 24' bgs.

Generalized description of rock type (fracture depths, etc.): Fine grained gray metawacke with quartz veins; faults present at approx. 59-63', 89-91', 99-101', and 127-129' bgs. Other possible transmissive fracture present at approx. 284' bgs.

Hydraulically Active Fractures Present? (Based on Heat Pulse Flow Meter Response)	
Port 1	Flow Up the Borehole Under Pumping Conditions
29-44 feet bgs	
Port 2	Yes - Flow Into and Down Under Ambient Conditions; Flow Into and Up Under Pumping Conditions
56-66 feet bgs	
Port 3	Yes - Flow Into and Down Under Ambient Conditions; Flow Into & Up and Into & Down Under Pumping Conditions
123-133 feet bgs	

Remarks and Well Details

bgs - below ground surface

NAVD88 - North American Vertical Datum of 1988

- Developed by surging with air hammer

- Locking cap and padlock installed

- Elevations recorded by Psilga & Day Land Surveyors, January 4 & 24, 2024. Elevations reference the North American Vertical Datum of 1988 (NAVD88) using GPS tied to the NGS CORS Network (via Maine Department of Transportation VRS GPS control network). Elevations computed from GEOID 18 based on two permanent benchmarks installed and observed in November 2020, upon which an OPUS solution was obtained and three wire levels were run.

LOW FLOW SAMPLING LOG (PERISTALTIC PUMP)

Credere Associates. LLC. 776 Main Street. Westbrook. ME 04092

PROJECT NAME: USACE Dow Salvage Yard DATE: 11/08/23

PROJECT NUMBER: 18001468

SAMPLE LOCATION ID: SY-OB MW-1

FINAL MONITORING PARAMETERS AFTER SAMPLING

TIME	TEMP (°C)	SP. COND (mS/cm)	pH	ORP (mV)	D.O. (mg/l)	TURBID. (ntu)	Flow Rate (mL/min)	DTW (ft)
1015	7.8	29420 uS/cm (0.029)	8.72	93.2	0.48	—	120	9.02

SAMPLE DATA:

SAMPLE BOTTLE ID TIME	SAMPLE BOTTLE ID LOCATION	PRESERVATION METHOD	SAMPLE CONTAINER #	SAMPLE CONTAINER TYPE	LABORATORY ANALYSIS
435	SY-OB MW-1	HCl	2	40 mL VOA	VOC
		HCl	2	40 mL VOA	VPH
		None	1	1 L Amber	SVOC
		None	1	1 L Amber	PCB
		HCl	1	1 L Amber	EPH
		HNO3	1	250 mL Poly	Total Metals
		HNO3 (filtered)	1	250 mL Poly	Dissolved Metals
		HCl	3	40 mL VOA	CVOC SIM
		HCl	2	40 mL VOA	TOC
		HCl	3	40 mL VOA	Dissolved Gasses
		None	1	500 mL Poly	Alkalinity, Hexavalent Chromium, Anions
		HCl	1	250 mL Poly	Ferrous Iron
		None	2	1 L Amber	BNASIM

PURGE DATA

[ ] 0.04 GAL/FT (1" DIAM.)
[X] 0.16 GAL/FT (2" DIAM.)
[ ] 0.65 GAL/FT (4" DIAM.)
[ ] 1.47 GAL/FT (6" DIAM.)

x length of water column = 31.22

Total Well Volume: ~~4.9~~ 5.00

Total Purge Volume: 9 gal

# of well volumes: ~1.8

COMMENTS For final monitoring parameters, water stopped pumping and turbidity reading could not be taken. Prior to this and during sampling, water still appeared clear.

DETAILED STABALIZATION CRITERIA

pH: ±0.1 standard units
Temperature: ± 3%
ORP: ±10 mV
DO: less than 0.5 mg/L or ±10% for values greater than 0.5 mg/L
Specific conductivitiy: ± 3%
Turbidity: <5 NTU or 10% for reading >5 NTU (filtered only)
Drawdown: no more than 0.3 feet

PROJECT NAME: USACE Dow Salvage Yard DATE: 11/08/23

PROJECT NUMBER: 18001468

SAMPLE LOCATION ID: SY-OB-MW8

FINAL MONITORING PARAMETERS AFTER SAMPLING

TIME	TEMP (°C)	SP. COND. (mS/cm)	pH	ORP (mV)	D.O. (mg/l)	TURBID. (ntu)	Flow Rate (mL/min)	DTW (ft)
1330	9.2	25150	7.80	139.4	0.44	4.00	400	11.01

SAMPLE DATA:

SAMPLE BOTTLE ID TIME	SAMPLE BOTTLE ID LOCATION	PRESERVATION METHOD	SAMPLE CONTAINER #	SAMPLE CONTAINER TYPE	LABORATORY ANALYSIS
1250	SY-OB-MW8	HCl	2	40 mL VOA	VOC
		HCl	2	40 mL VOA	VPH
		None	1	1 L Amber	SVOC
		None	1	1 L Amber	PCB
		HCl	1	1 L Amber	EPH
		HNO3	1	250 mL Poly	Total Metals
		HNO3 (filtered)	1	250 mL Poly	Dissolved Metals
		HCl	3	40 mL VOA	CVOC SIM
		HCl	2	40 mL VOA	TOC
		HCl	3	40 mL VOA	Dissolved Gasses
		None	1	500 mL Poly	Alkalinity, Hexavalent Chromium, Anions
		HCl	1	250 mL Poly	Ferrous Iron
		None	2	1 L Amber	BNA SIM

PURGE DATA

[ ] 0.04 GAL/FT (1" DIAM.)
[x] 0.16 GAL/FT (2" DIAM.)
[ ] 0.65 GAL/FT (4" DIAM.)
[ ] 1.47 GAL/FT (6" DIAM.)

x length of water column = 23.04

Total Well Volume: 3.69

Total Purge Volume: 11 gal

# of well volumes: ~2.98

COMMENTS

DETAILED STABALIZATION CRITERIA

pH: ±0.1 standard units
Temperature: ± 3%
ORP: ±10 mV
DO: less than 0.5 mg/L or ±10% for values greater than 0.5 mg/L
Specific conductivitiy: ± 3%
Turbidity: <5 NTU or 10% for reading >5 NTU (filtered only)
Drawdown: no more than 0.3 feet

x length of water column = 19.61

Total Well Volume: 3.1 gallons

Total Purge Volume: 6 gallons

# of well volumes: 1.9

COMMENTS # 2 1 Liter amber collected for BNA SIM analysis

DETAILED STABALIZATION CRITERIA

pH: ±0.1 standard units
Temperature: ± 3%
ORP: ±10 mV
DO: less than 0.5 mg/L or ±10% for values greater than 0.5 mg/L
Specific conductivitiy: ± 3%
Turbidity: <5 NTU or 10% for reading >5 NTU (filtered only)
Drawdown: no more than 0.3 feet

LABORATORY ANALYTICAL REPORTS

Laboratory Report

Absolute Resource associates
124 Heritage Avenue Portsmouth NH 03801

Allison Drouin
CREDERE Associates
776 Main Street
Westbrook, ME 04092

PO Number: 18001468
Job ID: 64446
Date Received: 2/6/23

Project: Dow 18001468

Attached please find results for the analysis of the samples received on the date referenced above.

Unless otherwise noted in the attached report, the analyses performed met the requirements of Absolute Resource Associates' Quality Assurance Plan. The Standard Operating Procedures are based upon USEPA SW-846, USEPA Methods for Chemical Analysis of Water and Wastewater, Standard Methods for the Examination of Water and Wastewater and other recognized methodologies. The results contained in this report pertain only to the samples as indicated on the chain of custody.

Absolute Resource Associates maintains certification with the agencies listed below. The reported results apply to the sample(s) in the condition as received at the time the laboratory took custody. This report shall not be reproduced except in full, without written approval of the laboratory. The liability of ARA is limited to the cost of the requested analyses, unless otherwise agreed upon in writing.

We appreciate the opportunity to provide laboratory services. If you have any questions regarding the enclosed report, please contact the laboratory and we will be glad to assist you.

Sincerely,
Absolute Resource Associates

Aaron DeWees
Chief Operating Officer

Quality Control Report

124 Heritage Avenue Unit 16
Portsmouth, NH 03801
www.absoluteresourceassociates.com

Case Narrative
Lab # 64446

Sample Receiving and Chain of Custody Discrepancies

Samples were received in acceptable condition, between 0 and 6 degrees C, on ice, and in accordance with sample handling, preservation and integrity guidelines.
The analyses performed met the requirements of Absolute Resource Associates' Quality Assurance Plan and the requirements set forth by the associated Sampling and Analysis Plan dated December 2022 (final).
Absolute Resource Associates is an ISO/IEC 17025:2017 DoD accredited "Testing Laboratory" through PJLA with an accreditation # 78237. The analyses performed met the requirements of Absolute Resource Associates' Quality Assurance Plan. Parameters included in the ARA current DoD certification also met the requirements set forth by the current DoD Quality Systems Manual, except as noted below.
The reported results are calculated on a "dry weight" basis.

Calibration

Metals: A CCV for Beryllium and Sodium associated with sample 64446-001, -002, and -003 was above acceptance criteria. Data has been qualified accordingly.

Method Blank

No exceptions noted.

Surrogate Recoveries

No exceptions noted.

Laboratory Control Sample Results

VOC: MLCS15933 did not meet the acceptance criteria for diethyl ether. This compound showed low recovery. MLCSD15933 did not meet the acceptance criteria for diethyl ether, methyl t-butyl ether (MTBE), and t-amyl-methyl ether (TAME). These compounds showed low recovery. No additional samples were available for re-analysis. The results have been qualified accordingly.
SVOC: LCS15930 did not meet the acceptance criteria for benzoic acid, 2,4-dinitrophenol, 4,6-dinitro-2-methylphenol, and benzidine. These compounds showed low recovery. The results have been qualified accordingly. There is no impact to the data suspected as these analytes were not identified as contaminants of concern.
Metals: The relative percent difference between the CRM and CRMD15957 was outside the acceptance criteria for Aluminum and Iron. The percent recovery for these elements in each QC parameter was within the acceptance criteria. The results have been qualified accordingly.

Matrix Spike/Matrix Spike Duplicate/Duplicate Results

SVOC: MS/D15930 (64446-001) did not meet the acceptance criteria for several compounds. Compounds that exhibited recoveries outside the acceptance criteria have been qualified with an "M." There is no impact to the data suspected as these analytes were not identified as contaminants of concern.

Metals: MS15957 (64446-001) did not meet the acceptance criteria for manganese, potassium, selenium, and zinc. The percent recovery was acceptable in the associated CRM/D. The recovery for the PDS for each is provided with the results. Matrix interference suspected. Sample results have been qualified accordingly.

Other

Reporting Limits: Dilutions performed during the analysis are noted on the result pages.

No other exceptions noted.

Data Qualifiers

U = This compound was analyzed for, but not detected above the associated limit of detection.
J = The analytical result was below the instrument calibration range, but above the method detection limit. The reported concentration is an estimate.
m = An "m" next to the "Response" value reported on the raw data sheets indicates a manual integration was performed.

Abbreviations for Manual Integrations

BC = Baseline Correction: The software integration of the baseline was inappropriate for the chromatogram
MI = Mis-Identification: The software integrated the incorrect peak
PS = Peak Separation: Two peaks exist in the chromatogram but the software integrated them as one
RI = Range Integration: Software does not perform range integrations, must be performed manually
NB = Noisy Baseline: Software mis-integrated due to a noisy baseline
PM = Peak Missed: Software did not integrate the target peak

Absolute Resource Associates does not hold DoD Certification for the following analytes:

Waters	Analyte	CAS	Reference
	1,3,5-trichlorobenzene	108-70-3	SW5030C8260D
	1,4-dioxane	123-91-1	SW5030C8260D
	diethyl ether	60-29-7	SW5030C8260D
	tetrahydrofuran (THF)	109-99-9	SW5030C8260D
	azobenzene	103-33-3	SW3510C8270E

GLOSSARY

%R	Percent Recovery
BLK	Blank (Method Blank, Preparation Blank)
CCB	Continuing Calibration Blank
CCV	Continuing Calibration Verification

Reviewer Checks:

- Quant Report: Reviewed, Analyst Initials & Date
- Chromatogram Checked, Major peaks identified
- Soil prep data checked: weight, volume, %solid, Prep date
- Field ID consistent with data and any field replicates
- Results consistent with any re-runs, LL results & internal QC
- Substitute dilution data checked
- Correct dilution and reason clear or noted
- Reason for reanalysis documented
- Surrogates pass or flagged & noted
- Flags checked (Expiration, F+, Over Cal)
- Other QC failures, estimates or interferences documented
- Spot checked Reported Result with Quant Report
- Checked Audit flagged data in LIMS

Prep#:	15933

Reviewer Checks:

- Quant Report: Reviewed, Analyst Initials & Date
- Chromatogram Checked, Major peaks identified
- Soil prep data checked: weight, volume, %solid, Prep date
- Field ID consistent with data and any field replicates
- Results consistent with any re-runs, LL results & internal QC
- Substitute dilution data checked
- Correct dilution and reason clear or noted
- Reason for reanalysis documented
- Surrogates pass or flagged & noted
- Flags checked (Expiration, F+, Over Cal)
- Other QC failures, estimates or interferences documented
- Spot checked Reported Result with Quant Report
- Checked Audit flagged data in LIMS

Reviewer Checks:

Quant Reports: Reviewed, Analyst Initials & Date
Chromatogram Checked, Major peaks identified
Prep data checked: weight, volume, %solid, Prep date
Field ID consistent with data and any field replicates
Results consistent with any re-runs & internal QC
Substitute dilution data checked
Correct dilution and reason clear or noted
Reason for reanalysis documented
Surrogates pass or flagged & noted
Flags checked (Expiration, F+, Over Cal)
Other QC failures, estimates or interferences documented
Spot checked Reported Result with Quant Report
Checked Audit flagged data in LIMS

Notes:

Reviewer Checks:

Quant Reports: Reviewed, Analyst Initials & Date
Chromatogram Checked, Major peaks identified
Prep data checked: weight, volume, %solid, Prep date
Field ID consistent with data and any field replicates
Results consistent with any re-runs & internal QC
Substitute dilution data checked
Correct dilution and reason clear or noted
Reason for reanalysis documented
Surrogates pass or flagged & noted
Flags checked (Expiration, F+, Over Cal)
Other QC failures, estimates or interferences documented
Spot checked Reported Result with Quant Report
Checked Audit flagged data in LIMS

Reviewer Checks:

- Quant Report: Reviewed? Ranges integrated? Analyst Initials & Date?
- Chromatogram Checked? Major peaks identified?
- Soil prep data checked: weight, volume, %solid, Prep date
- Field ID consistent with data and any field replicates
- Results consistent with any re-runs & internal QC
- Substitute dilution data checked
- Correct dilution and reason clear or noted
- Reason for reanalysis documented
- Surrogates pass or flagged & noted
- Flags checked (Expiration, F+, Over Cal)
- Other QC failures, estimates or interferences documented
- Spot checked Reported Result with Quant Report
- Checked Audit flagged data in LIMS

Reviewer Checks:

- Quant Report: Reviewed, Analyst Initials & Date
- Chromatogram Checked, Major peaks identified
- Prep data checked: weight, volume, %solid, Prep date
- Field ID consistent with data and any field replicates
- Results consistent with any re-runs & internal QC
- Correct dilution and reason clear or noted
- Reason for reanalysis documented
- Surrogates pass or flagged & noted
- Flags checked (Expiration, Over Cal)
- Other QC failures, estimates or interferences documented
- Spot checked Reported Result with Quant Report
- Checked Audit flagged data in LIMS
- Correct values averaged
- Column RPD is OK or both results included
- Correct column reported

Eurofins Lancaster Laboratories Environment Testing, LLC

Compliance Statement

Analytical test results meet all requirements of the associated regulatory program (e.g., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis. Data qualifiers are applied to note exceptions. Noncompliant quality control (QC) is further explained in narrative comments.
· QC results that exceed the upper limits and are associated with non-detect samples are qualified but further narration is not required since the bias is high and does not change a non-detect result. Further narration is also not required with QC blank detection when the associated sample concentration is non-detect or more than ten times the level in the blank.
· Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD is performed, unless otherwise specified in the method.
· Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.
Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Measurement uncertainty values, as applicable, are available upon request.

Test results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as "analyze immediately" and tested in the laboratory are not performed within 15 minutes of collection.

This report shall not be reproduced except in full, without the written approval of the laboratory.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. The foregoing express warranty is exclusive and is given in lieu of all other warranties, expressed or implied, except as otherwise agreed. We disclaim any other warranties, expressed or implied, including a warranty of fitness for particular purpose and warranty of merchantability. In no event shall Eurofins Lancaster Laboratories Environmental, LLC be liable for indirect, special, consequential, or incidental damages including, but not limited to, damages for loss of profit or goodwill regardless of (A) the negligence (either sole or concurrent) of Eurofins Lancaster Laboratories Environmental and (B) whether Eurofins Lancaster Laboratories Environmental has been informed of the possibility of such damages. We accept no legal responsibility for the purposes for which the client uses the test results. Except as otherwise agreed, no purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Qualifiers

General Chemistry

Qualifier	Qualifier Description
U	Undetected at the Limit of Detection.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative
410-114770-1

Receipt
The samples were received on 2/8/2023 10:04 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 6.2°C

Receipt Exceptions
The following samples were received at the laboratory outside the required temperature criteria: SY-SB4R-1 (410-114770-1), SY-SB4R-10 (410-114770-2) and SY-SB4R-2 (410-114770-3). This does not meet regulatory requirements. The client was contacted regarding this issue, and the laboratory was instructed to proceed with analysis.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Reagent

WC_TOC_SLCSCC_00007

1. The **Certified Values** are the actual "made-to" concentrations confirmed by ERA analytical verification. The certified values are monitored and purchasers will be notified of any significant changes resulting in recertification or withdrawal of this certified reference material during the period of validity of this certificate.

2. The **Uncertainty** represents an expanded uncertainty and approximates a 95% confidence interval. The uncertainty is based on the characterization, homogeneity and stability characteristics of the product, multiplied by a coverage factor (k=2). The uncertainty applies to the product as supplied and does not take into account any required or optional dilution and/or preparations the laboratory may perform while using this product. The formula used to calculate the expanded uncertainty is:
$U_{expanded} = k * SQRT((U_{char}^2) + (U_{homogen}^2) + (U_{LTS}^2) + (U_{STS}^2) + (U_{RSS}^2))$

Where:

$U_{expanded}$ = Expanded uncertainty.
k = Coverage factor.
U_{char} = Combined standard uncertainty of the manufacturing and/or analytical verification assessment.
$U_{homogen}$ = Standard uncertainty of the homogeneity assessment.
U_{LTS} = Standard uncertainty associated with long-term stability.
U_{STS} = Standard uncertainty associated with short-term (transport) stability.
U_{RSS} = Standard uncertainty associated with repeated sampling of the product (where permitted by product use instructions).

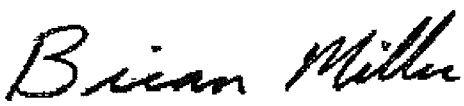
3. The **QC Performance Acceptance Limits (QC PALs™)** are based on actual historical data collected in ERA's Proficiency Testing program. The QC PALs™ reflect any inherent biases in the methods used to establish the limits and closely approximate a 95% confidence interval of the performance that experienced laboratories should achieve using accepted environmental methods. Use the QC PALs™ to realistically evaluate your performance against your peers.

4. The **PT Performance Acceptance Limits (PT PALs™)** are calculated using the regression equations and fixed acceptance criteria specified in the NELAC proficiency testing requirements. Use the PT PALs™ when analyzing this certified reference material alongside USEPA and NELAC compliant PT study materials. Please note that many PT study acceptance limits are concentration dependent (some non-linearly) and therefore, the acceptance limits of this certified reference material and any PT study material may differ relative to their difference in concentrations.

5. The **PT Performance Data** include the mean value, percent recovery and number of data points reported by laboratories in our Proficiency Testing study compared to the Certified Values. In the event this lot was not used in a proficiency testing scheme, the data displayed was generated internally by ERA.

6. Where NIST Standard Reference Materials (SRMs) are available, each analyte has been analytically traced to the NIST SRM listed. **Analytical Traceability Recovery (%)** = [(% recovery ERA certified reference material)/(% recovery NIST SRM)]*100
The traceability data shown were compiled by analyzing this ERA certified reference material and/or it's associated stock solution(s) against the applicable NIST SRMs.

7. The **Reference Values** are equal to the mean recoveries for the parameters as determined in an interlaboratory round robin study. The **Reference Values** represent the expected performance for the analytes in this standard. ERA recommends using the **Reference Values** when assessing or evaluating your results.



8. **Metrological Traceability**. This certified reference material is metrologically traceable to NIST mass reference materials through an unbroken chain of comparisons.

9. For additional information on this product such as intended use, storage information, instructions for use, minimum sample size, and safety information, please refer to the Product Use Instructions provided.

If you have any questions or need technical assistance, please call ERA technical assistance at 1-800-372-0122 or send an email to info@eraqc.com.

Question	Answer	Comment
The cooler's custody seal is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable (</=6C, not frozen).	False	Cooler temperature outside required temperature criteria.
Cooler Temperature is recorded.	True	
WV: Container Temperature is acceptable (</=6C, not frozen).	N/A	
WV: Container Temperature is recorded.	N/A	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the containers received and the COC.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses.	True	
Is the Field Sampler's name present on COC?	False	Received project as a subcontract.
Sample custody seals are intact.	N/A	
VOA sample vials do not have headspace >6mm in diameter (none, if from WV)?	N/A

Sample Receipt

The following samples were received on February 01, 2023 and were logged in under Katahdin Analytical Services work order number SQ0595 for a hardcopy due date of February 27, 2023.

KATAHDIN Sample No.	CREDERE Sample Identification
SQ0595-1	SY-SB4R-1
SQ0595-2	SY-SB4R-10
SQ0595-3	SY-SB4R-2

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAP standards unless otherwise noted in this narrative or in the Report of Analysis.

We certify that the test results provided in this report are accredited under the laboratory's ISO/IEC 17025:2017 and DoD-ELAP accreditation issued by the ANSI-ASQ National Accreditation Board. Refer to certificate and scope of accreditation L2223.

Analytes which are reported but not listed on our ANAB scope of accreditation will be "^" flagged and the following language will be included in the case narrative for all DoD compliant work: "^" Indicates this analyte is not included on Katahdin Analytical Services DoD-ELAP Scope of Accreditation.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Heather Manz**. This narrative is an integral part of the Report of Analysis.

Organics Analysis

The samples of Work Order SQ0595 were analyzed in accordance with Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, EPA publication SW-846, Third Edition, Final Updates I (1993), II (1995), IIA (1994), IIB (1995), III (1997), IIIA (1999), IIIB (2005), IV (2008), V (2015) and VI (2019) and/or for the specific methods listed below or on the Report of Analysis.

8270D SIM PAH Analysis

Every sample was manually integrated for the target analytes benzo(b)fluoranthene and/or benzo(k)fluoranthene. The specific reasons for the manual integrations are indicated on the raw data by the manual integration codes (M1-M11). These codes are further explained in the attachment following this narrative.

Note: The Form VII has a column for %D that is set to 20%. The DoD QSM criterion for an opening CV is 20%D and a closing CV is 50%D. All of the compounds in the CV's were evaluated to either 20% criteria for opening CV's or 50% criteria for closing CV's.

There were no other protocol deviations or observations noted by the organics laboratory staff.

Wet Chemistry Analysis

The samples of Work Order SQ0595 were analyzed in accordance with the specific methods listed on the Report of Analysis.

Analyses for total solids and hexavalent chromium were performed according to "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", EPA publication SW-846, Third Edition, Final Updates I (1993), II (1995), IIA (1994), IIB (1995), III (1997), IIIA (1999), IIIB (2005), IV (2008), and V (2015).

All Wet Chemistry results were evaluated to Katahdin Analytical Services' Method Detection Limits (MDL). Measured concentrations that fall between the MDL and Katahdin's Limit of Quantitation (LOQ) are flagged "J". Measured concentrations that are below the MDL are flagged "U" and reported as "U LOD", where "LOD" is the numerical value of the Limit of Detection.

All quality control criteria were met. All analyses were performed within analytical holding times, with the following exception:

Due to fume hood issues, the hexavalent chromium analysis was performed on day 42 of the 30-day method-specified analytical holding time. The client was contacted.

Subcontracted Data

Analyses for Total Organic Carbon (TOC) by Method Lloyd Kahn were performed by a subcontract laboratory. Please refer to the section of the data package titled Subcontracted Data.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Quality Assurance Officer, or their designee, as verified by the following signature.

Katahdin Analytical Services, Inc.

Manual Integration Codes For GC/MS, GC, HPLC and/or IC

M1	Peak splitting.
M2	Well defined peaks on the shoulders of the other peaks.
M3	There is additional area due to a coeluting interferant.
M4	There are negative spikes in the baseline.
M5	There are rising or falling baselines.
M6	The software has failed to detect a peak or misidentified a peak.
M7	Excessive peak tailing.
M8	Analysis such as GRO, DRO and TPH require a baseline hold.
M9	Peak was not completely integrated as in GC/MS.
M10	Primary ion was correctly integrated, but secondary or tertiary ion needed manual integration as in GC/MS.
M11	For GC analysis, when a sample is diluted by 1:10 or more, the surrogate is set to undetected and then the area under the surrogate is manually integrated.
M12	Manual integration saved in method due to TurboChrom floating point error.

Katahdin Analytical Services, LLC. — Sample Receipt Condition Report

Client: Credere	KAS PM: HHM	Sampled By: Client
Project:	KIMS Entry By: RD	Delivered By: KAS
KAS Work Order#: SQ 0595	KIMS Review By: HHM	Received By: GP
	Labeled By: GP	
SDG #:	Cooler: 1 of 1	Date/Time Rec.: 2/6/23 1535

Receipt Criteria	Y	N	EX*	NA	Comments and/or Resolution
1. Custody seals present / intact?		/			
2. Chain of Custody present in cooler?	/				
3. Chain of Custody signed by client?	/				
4. Chain of Custody matches samples?	/				
5. Temperature Blanks present? If not, take temperature of any sample w/ IR gun.	/				Temp (°C): 2.8 — Thermometer ID: IR-1
Samples received at <6 °C w/o freezing?	/				Note: Not required for metals (except Hg soil) analysis.
Ice packs or ice present?	/				The lack of ice or ice packs (i.e. no attempt to begin cooling process) or insufficient ice may not meet certain regulatory requirements and may invalidate certain data.
If yes, was there sufficient ice to meet temperature requirements?	/				
If temp. out, has the cooling process begun (i.e. ice or packs present) and sample collection times <6hrs., but samples are not yet cool?				/	Note: No cooling process required for metals (except Hg soil) analysis.
6. Volatiles: **Aqueous:** No bubble larger than a pea?				/	
Soil/Sediment: Received in airtight container?				/	
Received in methanol?				/	
Methanol covering soil?				/	
D.I. Water - Received within 48 hour HT?				/	
7. Trip Blank present in cooler?				/	
8. Proper sample containers and volume?	/				
9. Samples within hold time upon receipt?	/				
10. Aqueous samples properly preserved? Metals, COD, NH3, TKN, O/G, phenol, TPO4, N+N, TOC, DRO, TPH – pH <2				/	
Sulfide - >9				/	
Cyanide – pH >12				/	
11. Bottleware Prepped on:				/	

* Log-In Notes to Exceptions: document any problems with samples or discrepancies or pH adjustments.

SAMPLE DATA SUMMARY PACKAGE

KATAHDIN ANALYTICAL SERVICES - ORGANIC DATA QUALIFIERS

U Indicates the compound was analyzed for but not detected above the specified level. This level may be the Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), the Limit of Detection (LOD) or Method Detection Limit (MDL) as required by the client.

Note: All results reported as "U" MDL have a 50% rate for false negatives compared to those results reported as "U" PQL, "U" LOQ or "U" LOD, where the rate of false negatives is <1%.

* Compound recovery or percent RPD (relative percent difference) was outside of quality control limits.

D Indicates the result was obtained from analysis of a diluted sample. Surrogate recoveries may not be calculable.

E Estimated value. This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis.

J Estimated value. The analyte was detected in the sample at a concentration less than the laboratory Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), but above the Method Detection Limit (MDL).

And/or

J Used for Dual Column analytes when there is a greater than 40% difference for detected concentrations between the two GC/HPLC columns.

B Indicates the analyte was detected in the laboratory method blank analyzed concurrently with the sample.

I Indicates that the flagged compound did not meet DoD criteria in the corresponding Initial Calibration (ICAL).

D Indicates that the flagged compound did not meet DoD criteria in the corresponding Initial Calibration Verification (ICV).

C Indicates that the flagged compound did not meet DoD criteria in the corresponding opening Calibration Verification (CV).

V Indicates that the flagged compound did not meet DoD criteria in the corresponding closing Calibration Verification (CV).

L/LL Indicates that the flagged compound did not meet DoD criteria in the corresponding Laboratory Control Sample (LCS) and/or Laboratory Control Sample Duplicate (LCSD) prepared and/or analyzed concurrently with the sample.

M/MM Indicates that the flagged compound did not meet DoD criteria in the Matrix Spike (MS) and/or Matrix Spike Duplicate MSD) prepared and/or analyzed concurrently with the native sample.

H Indicates the flagged compound was detected on the primary column but was not detected on the confirmation column therefore the compound is not reported as a positive detection. (SW846 8330A/B only)

KATAHDIN ANALYTICAL SERVICES – INORGANIC DATA QUALIFIERS

The sampled date indicated on the attached Report(s) of Analysis (ROA) is the date for which a grab sample was collected or the date for which a composite sample was completed. Beginning and start times for composite samples can be found on the Chain-of-Custody.

U Indicates the compound was analyzed for but not detected above the specified level. This level may be the Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), the Limit of Detection (LOD) or Method Detection Limit (MDL) as required by the client.

Note: All results reported as "U" MDL have a 50% rate for false negatives compared to those results reported as "U" PQL "U" LOQ or "U" LOD, where the rate of false negatives is <1%.

E Estimated value. This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis.

J Estimated value. The analyte was detected in the sample at a concentration less than the laboratory Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), but above the Method Detection Limit (MDL).

I-7 The laboratory's Practical Quantitation Level (PQL) or LOQ could not be achieved for this parameter due to sample composition, matrix effects, sample volume, or quantity used for analysis.

A-4 Please refer to cover letter or narrative for further information.

H_ Please note that the regulatory holding time for _____ is "analyze immediately". Ideally, this analysis must be performed in the field at the time of sample collection. _____ for this sample was not performed at the time of sample collection. The analysis was performed as soon as possible after receipt by the laboratory.

H1 - pH H2 - DO H3 - sulfite H4 - residual chlorine

T1 The client did not provide the full volume of at least one liter for analysis of TSS. Therefore, the PQL of 2.5 mg/L could not be achieved.

T2 The client provided the required volume of at least one liter for analysis of TSS, but the laboratory could not filter the full one liter volume due to the sample matrix. Therefore, the PQL of 2.5 mg/L could not be achieved.

M1 The matrix spike and/or matrix spike duplicate recovery performed on this sample was outside of the laboratory acceptance criteria. Sample matrix is suspected. The laboratory criteria was met for the Laboratory Control Sample (LCS) analyzed concurrently with this sample.

M2 The matrix spike and/or matrix spike duplicate recovery was outside of the laboratory acceptance criteria. The native sample concentration is greater than four times the spike added concentration so the spike added could not be distinguished from the native sample concentration.

R1 The relative percent difference (RPD) between the duplicate analyses performed on this sample was outside of the laboratory acceptance criteria (when both values are greater than ten times the PQL).

MCL	Maximum Contaminant Level	NL	No limit
NFL	No Free Liquid Present	FLP	Free Liquid Present
NOD	No Odor Detected	TON	Threshold Odor Number

D-1 As required by Method 5210B, APHA Standard Methods for the Examination of Water and Wastewater (21st edition), the BOD value reported for this sample is 'qualified' because the check standard run concurrently with the sample analysis did not meet the criteria specified in the method (198 +/- 30.5 mg/L). These results may not be reportable for compliance purposes.

D-2 The measured final dissolved oxygen concentrations of all dilutions were less than the method-specified limit of 1 mg/L. The reported BOD result was calculated assuming a final oxygen concentration equal to 1 mg/L. The reported value should be considered a minimum value.

D-3 The dilution water used to prepare this sample did not meet the method and/or regulatory criteria of less than 0.2 or 0.4 mg/L dissolved oxygen (DO) uptake over the five day period of incubation. These results may not be reportable for compliance purposes.

Method Blank Summary

Lab Name : Katahdin Analytical Services
SDG : SQ0595
Lab File ID : N7594.D
Lab Sample ID : WG332122-1
Instrument ID : GCMS-N
Date Extracted : 08-FEB-23
Matrix : SL
Date Analyzed : 03-MAR-23
Extraction method : SW846 3550C
Time Analyzed : 20:57

This Method Blank applies to the following samples and QC samples:

Client Sample ID	Lab Sample ID	Lab File ID	Date Analyzed	Time Analyzed
SY-SB4R-1	SQ0595-1	N7597.D	03/03/23	22:53
SY-SB4R-10	SQ0595-2	N7598.D	03/03/23	23:32

Sample Data Section

KATAHDIN ANALYTICAL SERVICES - ORGANIC DATA QUALIFIERS

U Indicates the compound was analyzed for but not detected above the specified level. This level may be the Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), the Limit of Detection (LOD) or Method Detection Limit (MDL) as required by the client.

Note: All results reported as "U" MDL have a 50% rate for false negatives compared to those results reported as "U" PQL, "U" LOQ or "U" LOD, where the rate of false negatives is <1%.

* Compound recovery or percent RPD (relative percent difference) was outside of quality control limits.

D Indicates the result was obtained from analysis of a diluted sample. Surrogate recoveries may not be calculable.

E Estimated value. This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis.

J Estimated value. The analyte was detected in the sample at a concentration less than the laboratory Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), but above the Method Detection Limit (MDL).

And/or

J Used for Dual Column analytes when there is a greater than 40% difference for detected concentrations between the two GC/HPLC columns.

B Indicates the analyte was detected in the laboratory method blank analyzed concurrently with the sample.

I Indicates that the flagged compound did not meet DoD criteria in the corresponding Initial Calibration (ICAL).

D Indicates that the flagged compound did not meet DoD criteria in the corresponding Initial Calibration Verification (ICV).

C Indicates that the flagged compound did not meet DoD criteria in the corresponding opening Calibration Verification (CV).

V Indicates that the flagged compound did not meet DoD criteria in the corresponding closing Calibration Verification (CV).

L/LL Indicates that the flagged compound did not meet DoD criteria in the corresponding Laboratory Control Sample (LCS) and/or Laboratory Control Sample Duplicate (LCSD) prepared and/or analyzed concurrently with the sample.

M/MM Indicates that the flagged compound did not meet DoD criteria in the Matrix Spike (MS) and/or Matrix Spike Duplicate MSD) prepared and/or analyzed concurrently with the native sample.

H Indicates the flagged compound was detected on the primary column but was not detected on the confirmation column therefore the compound is not reported as a positive detection. (SW846 8330A/B only)

Katahdin Analytical Services, Inc.

Manual Integration Codes For GC/MS, GC, HPLC and/or IC

M1	Peak splitting.
M2	Well defined peaks on the shoulders of the other peaks.
M3	There is additional area due to a coeluting interferant.
M4	There are negative spikes in the baseline.
M5	There are rising or falling baselines.
M6	The software has failed to detect a peak or misidentified a peak.
M7	Excessive peak tailing.
M8	Analysis such as GRO, DRO and TPH require a baseline hold.
M9	Peak was not completely integrated as in GC/MS.
M10	Primary ion was correctly integrated, but secondary or tertiary ion needed manual integration as in GC/MS.
M11	For GC analysis, when a sample is diluted by 1:10 or more, the surrogate is set to undetected and then the area under the surrogate is manually integrated.
M12	Manual integration saved in method due to TurboChrom floating point error.

QC Flag Legend

a - Target compound detected but, quantitated amount
    Below Limit Of Quantitation(BLOQ).
Q - Qualifier signal failed the ratio test.
R - Spike/Surrogate failed recovery limits.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
A - Target compound detected but, quantitated amount
exceeded maximum amount.
Q - Qualifier signal failed the ratio test.
R - Spike/Surrogate failed recovery limits.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

QC Flag Legend

a - Target compound detected but, quantitated amount
    Below Limit Of Quantitation(BLOQ).
Q - Qualifier signal failed the ratio test.
R - Spike/Surrogate failed recovery limits.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
A - Target compound detected but, quantitated amount
exceeded maximum amount.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

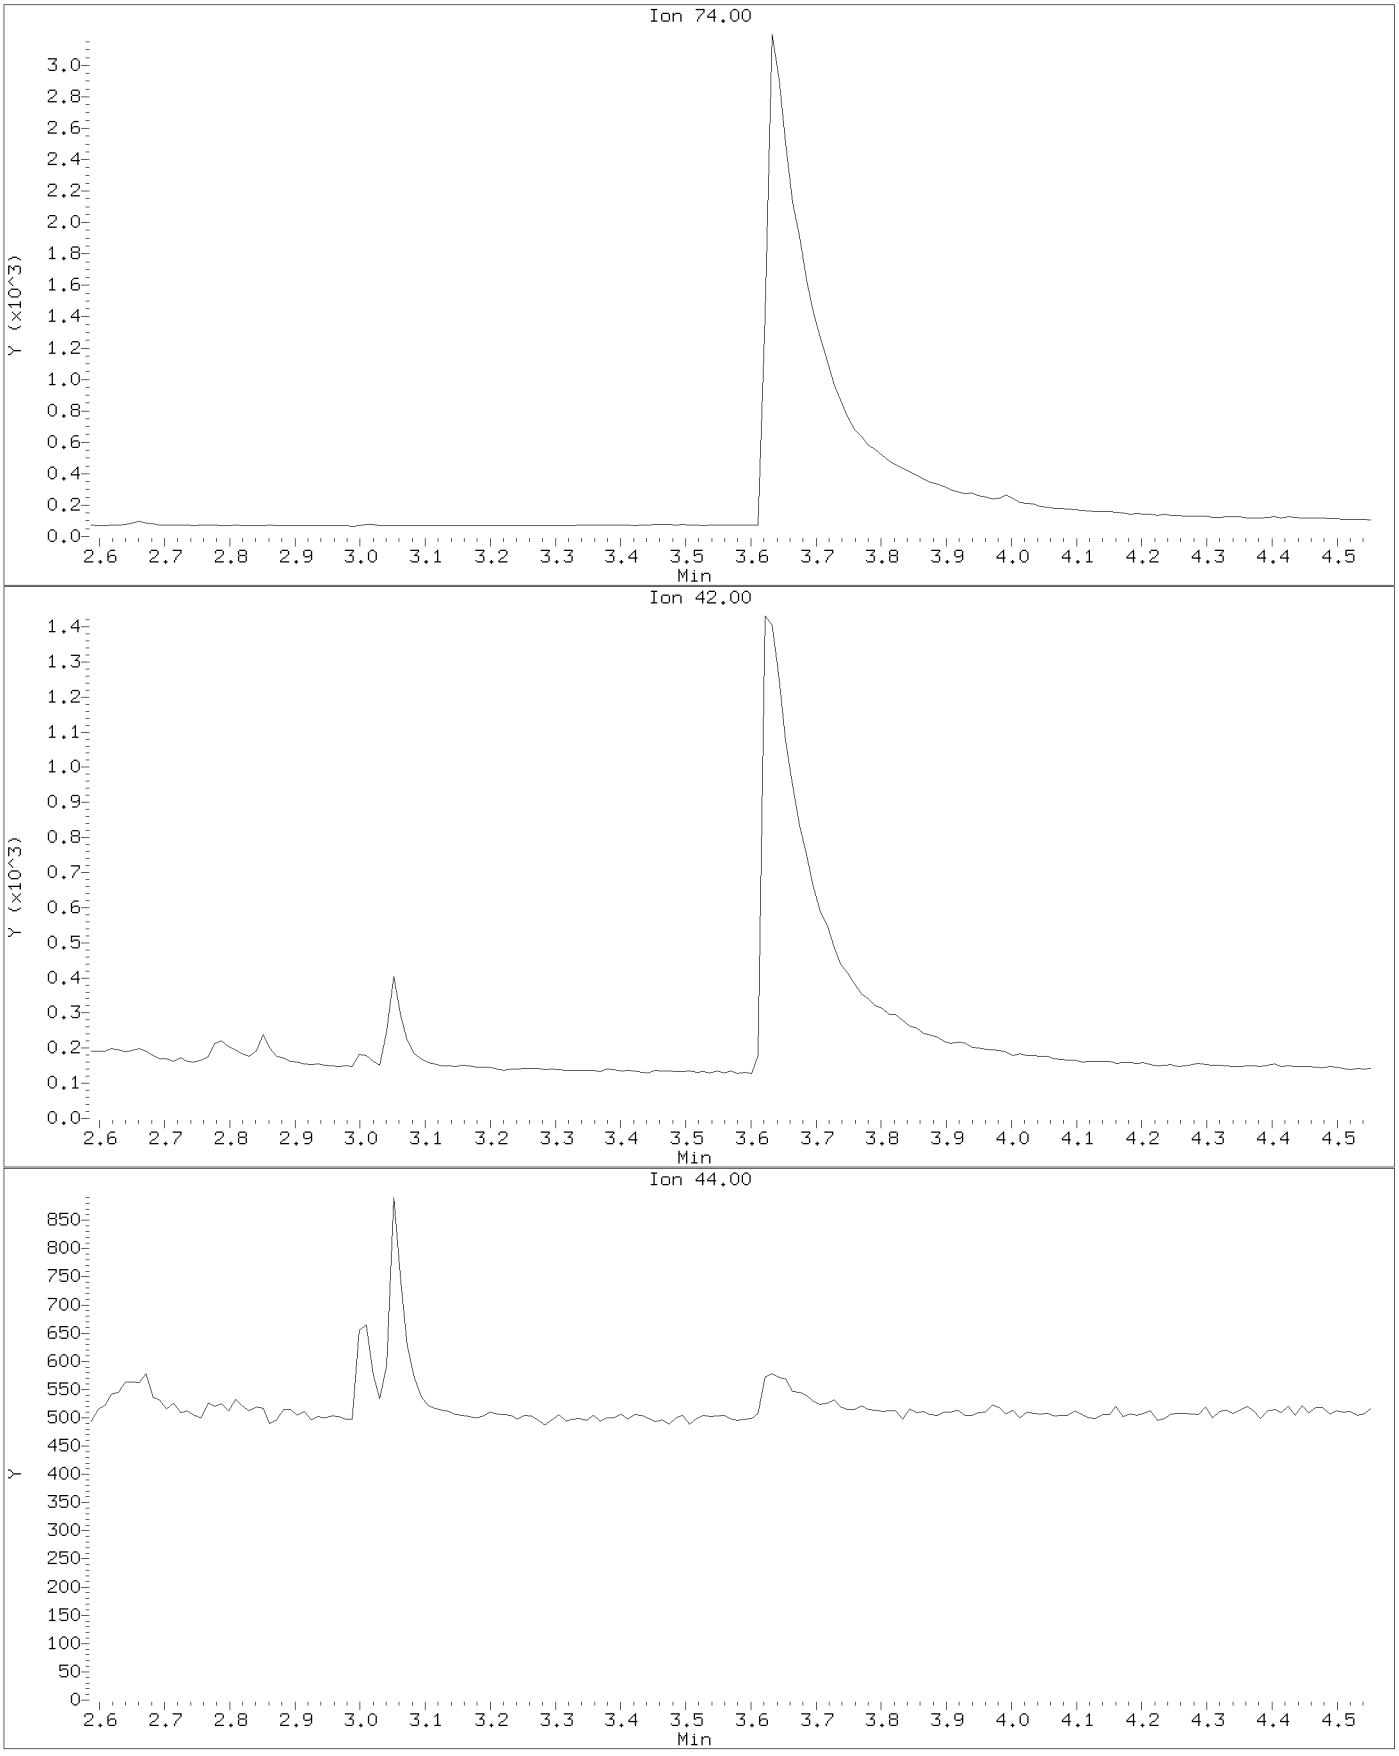
QC Flag Legend



a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
Q - Qualifier signal failed the ratio test.
R - Spike/Surrogate failed recovery limits.
H - Operator selected an alternate compound hit.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
Q - Qualifier signal failed the ratio test.
R - Spike/Surrogate failed recovery limits.
H - Operator selected an alternate compound hit.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
A - Target compound detected but, quantitated amount
exceeded maximum amount.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
Q - Qualifier signal failed the ratio test.
R - Spike/Surrogate failed recovery limits.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
Q - Qualifier signal failed the ratio test.
R - Spike/Surrogate failed recovery limits.
H - Operator selected an alternate compound hit.

QC Flag Legend

a - Target compound detected but, quantitated amount
    Below Limit Of Quantitation(BLOQ).
Q - Qualifier signal failed the ratio test.
R - Spike/Surrogate failed recovery limits.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.
